EXECUTIVE SUMMARY

Background

Main Roads Western Australia (MRWA) proposes to construct a new 38 km section of the Perth-Darwin National Highway (Swan Valley Section) (see Figure 1) extending between Malaga and Muchea in Western Australia. The project consists of the construction of a dual carriageway highway which will connect the intersection of Tonkin Highway and Reid Highway in the south with Great Northern Highway and Brand Highway in the north.

In November 2015, MRWA commissioned the pre-construction baseline groundwater and surface water quality assessment. Initial works identified critical data gaps within the existing groundwater monitoring network, including the absence of monitoring wells in key locations. To provide adequate coverage of groundwater resources, a suitable groundwater monitoring network was installed in January 2016.

A total of 55 groundwater monitoring bores and 22 surface water locations were monitored as part of the overall program. In alignment with Ministerial Statement No. 1036 the baseline survey groups have been separated into two separate groups with this report focusing on the Aquatic Ecosystems Group.

It is understood that construction of the road started on June 12, 2017.

Project Objectives

The overarching objective of this pre-construction baseline groundwater and surface water survey is to develop a comprehensive groundwater and surface water baseline data set, across the proposal footprint in order to meet requirements of Ministerial Statement No. 1036, conditions 14-3, 14-5 and 14-6 such that trigger and threshold criteria can be established and future project environmental performance can be monitored and measured against key parameters.

Environmental Setting

The project is situated in the northern part of the Perth Basin, comprising deeper Jurassic and Cretaceous age sediments overlain by late Tertiary and Quaternary age sediments.

The site traverses predominantly across superficial deposits of Bassendean Sands, a geological unit characterised by pale grey to white sub-rounded quartz sand, predominantly medium-grained, however can exhibit material ranging from fine to coarse grain. A layer of friable, limonite-cemented sand, colloquially called 'coffee rock', occurs throughout most of the area near the water table (Golder 2014). The Bassendean sands unconformably overlie the sedimentary rock sequence of the Perth Basin that sit on the Precambrian crystalline rocks of the Yilgarn Craton.

Surface Water and Groundwater Baseline Survey

The baseline groundwater and surface water survey commenced in December 2015 and was completed in May 2017. This baseline survey has been conducted in general accordance with the Coffey (2016b) draft Flora and Vegetation – Inland Waters Environmental Quality – Hydrological Processes – Baseline Survey Plan (BSP) (Coffey, 2016b) and the for Flora and Vegetation – Inland Waters Environmental Quality – Hydrological Processes – Condition EMP (CEMP) (Coffey, 2016).

Sampling and analysis activities were implemented to assess the baseline conditions of groundwater and surface water values along the project alignment and adjacent to sensitive ecological receptors including:

1. The major surface water features intercepted by the project footprint included both the Ellen Brook and Bennett Brook catchments. The alignment also intercepts two other minor catchments referred to as Henley Brook and St Leonards Creek catchments.
2. Twenty Conservation Category Wetlands (CCWs) occur along the length of the proposal footprint. Seven of the CCW are located within or partially within the proposal footprint. The remaining CCWs are to varying degrees within 75 m of the proposal footprint.
3. A number of occurrences of Mound Springs Swan Coastal Plan (SCP) adjacent to the project footprint. The Mound Springs SCP Threatened Ecological Communities (TEC) is characterised by continuous discharge of groundwater in raised areas of peat, which provide a stable, permanently moist series of microhabitats.
4. The Gngangara Mound which is currently the most significant source of groundwater for the Perth region as well as a vital part of groundwater dependent ecosystems. The project intercepts a number of priority areas and protection zones of the Gngangara Underground Water Pollution Control Area (GUWPCA) including:
 - a) Priority 1 area – areas that are managed to ensure no degradation of the drinking water source occurs. These areas contain the greatest restrictions on land use and activity and aim to avoid all risks to the drinking water source.
 - b) Priority 3 area – areas where management of risk to water sources from catchment activities are targeted. These are principally areas where existing land use co-exists with water supply sources.
 - c) Eight Wellhead Protection Zones (WHPZ) – circular zones established around groundwater production wells to protect drinking water sources from contamination. In Priority 1 areas WHPZ have a radius of 500 m, in Priority 2 and 3 areas the radius is 300 m. Special conditions, such as restrictions on storage and use of chemicals, may apply within these zones (DOW, 2006c).

Adopted Assessment Criteria

The adoption of assessment criteria used to assess baseline conditions of both surface water and groundwater along the proposal footprint varies with respect to the key receiving environments and sensitivity of receptors, however includes:

- Australian and New Zealand Environment and Conservation Council (ANZECC)(2000) Fresh water 95% level protection for slightly to moderately disturbed ecosystems;
- ANZECC (2000) Lowland River default levels for slightly to moderately disturbed ecosystems; and
- Department of Environmental Regulation (DER) (2015) Treatment and management of soil and water in acid sulfate soil landscapes.

Results

Groundwater levels within the proposal footprint experience a seasonal high following the wet season (around September/October) and are at a seasonal low around April/May. Calculation of groundwater relative levels (RLs) in meters Australian Height Datum (mAHD) range from approximately 27 mAHD at the most southern section of the alignment (MW01) to 55 mAHD at MW42.

Groundwater levels measured in MW42 have periodically registered groundwater levels greater than the ground height. The reason for this is identified as the well location intercepting groundwater under pressure within an area of the Mound Springs SCP TEC buffer zones characterised by continuous discharge of groundwater in raised areas of peat and other organic deposits.

Trace metals and metalloids indicate that aluminium, cadmium and zinc are commonly elevated within groundwater resources along the alignment. Surface water bodies are generally buffered from elevated trace metals however exhibit soluble aluminium concentrations in excess of the ANZECC Freshwater (95% protection level) criteria.

Evidence suggests that portions of the alignment are already subject to acidification or groundwater is susceptible to acidification via disturbance and oxygenation from activities such as dewatering. Low pH, alkalinity and acidity concentrations along with low alkalinity ratios and high dissolved Aluminium concentrations are key indicators for this. Depleted alkalinity along the alignment is indicative of groundwater that is unable to maintain a stable pH range following groundwater table fluctuations.

Nutrient concentrations indicate that low levels of ammoniacal nitrogen is present however elevated total nitrogen levels indicate a possible source of inorganic nitrogen is present in the system.

Overall the baseline survey program was conducted in line with the CEMP and BSP. Quality assurance and quality control review indicates the analytical data to be a suitability quality for interpretation purposes.

Recommendations

The following recommendations are made with respect to the baseline surface and groundwater monitoring program:

1. Update the interim site specific trigger and threshold criteria for key water quality parameters to provide a set of assessment levels such that data will include seasonal high and lows and that the future project environmental performance can be monitored and measured against key parameters.

Details relating to determining the site specific trigger and threshold criteria can be found in Appendix M.

1 INTRODUCTION

1.1 Background

Main Roads Western Australia (MRWA) proposed to construct a new 38 km section of the Perth-Darwin National Highway (Swan Valley Section) (Figure 1) extending between Malaga and Muchea in Western Australia (the project). The project consists of the construction of a dual carriageway highway that will connect the intersection of Tonkin Highway and Reid Highway in the south with Great Northern Highway and Brand Highway in the north.

In November 2015, MRWA commissioned the pre-construction baseline groundwater and surface water quality assessment comprising a detailed desktop assessment, site walkover to identify surface water locations and existing groundwater monitoring wells and implementation of a monthly sampling and analysis regime to characterise pre-construction water quality along the alignment. Initial works identified critical data gaps within the existing groundwater monitoring network, including the absence of monitoring wells in key locations and the unsuitable screening of the existing monitoring wells for geochemical analysis. To provide adequate coverage of groundwater resources, a suitable groundwater monitoring network was installed in January 2016.

The sampling program was subsequently amended to include the new monitoring locations and additional sample and analysis requirements. A total of 55 groundwater monitoring bores and 22 surface water locations were monitored as part of the overall program. In alignment with Ministerial Statement No. 1036 the baseline survey groups have been separated into two separate groups with this report focusing on the Aquatic Ecosystems Group (i.e not all groundwater wells and surface water locations).

It is understood that construction of the road started on June 12, 2017.

1.2 Purpose of Document

This report has been developed to assist with fulfilling conditions 14-3, 14-5 and 14-6 as required by Ministerial Statement No. 1036. This report presents the findings from the entire 17 month period of the pre-construction baseline groundwater and surface water survey, including assessment of water quality against relevant available assessment criteria and presentation of key trends in critical water quality parameters.

Interim threshold and trigger criteria been developed based on the first 11 month period and are presented within the Draft Environmental Flora and Vegetation Inland Waters Quality – Hydrological Processes – Condition Environmental Management Plan (Coffey, 2016). Upon the completion of this baseline survey report, it is proposed that the interim threshold and trigger criteria are updated.

1.3 Project Objectives

The overarching objective of this pre-construction baseline groundwater and surface water survey is to develop a comprehensive groundwater and surface water baseline data set, across the proposal footprint in order to meet requirements of Ministerial Statement No. 1036, conditions 14-3, 14-5 and 14-6 such that trigger and threshold criteria can be established and future project environmental performance can be monitored and measured against key parameters. Ministerial Statement conditions specific to the baseline survey phase of work are presented in Table 1.1 below.

Table 1.1 Relevant Ministerial Statement conditions

Condition number	Condition
14-3	The proponent shall undertake baseline surveys prior to ground disturbing activities for the purpose of establishing trigger and threshold criteria as required by condition 8-2.
14-5	After receiving notice in writing from the CEO that the Baseline Survey Plan satisfies the requirements of condition 14-4, the proponent shall undertake the baseline surveys in accordance with the requirements of the Baseline Survey Plan.
14-6	On completion of the baseline surveys the proponent shall report to the CEO on the following: <ol style="list-style-type: none">1. Completion of the baseline surveys in accordance with the Baseline Survey Plan.2. The results of the baseline surveys.

1.4 Scope of Work

To achieve the objectives of the monitoring program the following scope of works were undertaken:

- Desktop review including:
 - Review of relevant environmental policies, strategies and criteria.
 - Review of Public Environmental Report (PER) documentation presenting details on environmental attributes, values and issues of concern.
 - Determination of potential environment impact and disturbances from the proposed development.
- An initial groundwater monitoring well condition assessment and baseline monitoring round for the previously existing wells and surface water locations.
- Development and installation of a groundwater monitoring well network.
- Ongoing baseline groundwater and surface water survey (17 rounds).

2 ENVIRONMENTAL SETTING

2.1 Regional Geology

The project is situated in the northern part of the Perth Basin, comprising deeper Jurassic and Cretaceous age sediments overlain by late Tertiary and Quaternary age sediments.

The site traverses predominantly across superficial deposits of Bassendean Sands, a geological unit characterised by pale grey to white sub-rounded quartz sand, predominantly medium-grained, however can exhibit material ranging from fine to coarse grain. A layer of friable, limonite-cemented sand, colloquially called 'coffee rock', occurs throughout most of the area near the water table (Golder 2014). The Bassendean sands unconformably overlie the sedimentary rock sequence of the Perth Basin that sit on the Precambrian crystalline rocks of the Yilgarn Craton (Golder, 2014).

2.2 Hydrogeology

The regional hydrogeological conditions within which the project footprint is situated can be broadly characterised into three hydrogeological domains (Figure 2) (Golder, 2014).

- Hydrogeological Domain 1 (southern part of the alignment) – Bassendean Sand deposits are generally thicker and groundwater elevations are generally 3 m to 10 m below ground surface. Surface water and wetlands are still present in this section and are considered to be associated with the intersection of the groundwater level with the ground surface in interdunal depressions or swales. However, some of these wetlands may also be perched groundwater in distinct areas or pockets of low permeability material either at or below ground surface.
- Hydrogeological Domain 2 – Springs and wetlands are most common along the interface between the Guildford Formation and the Bassendean Sand. Groundwater levels have historically been within 1 m to 5 m of ground surface within the domain. Springs and wetlands have been known to form in the domain as groundwater can potentially intersect the ground surface as a result of the difference in permeability of the Bassendean Sand and Guildford Formation.
- Hydrogeological Domain 3 (northern section of the alignment) – The Guildford Formation is the dominant geological unit of Domain 3. During heavy rainfall, water may become temporarily perched on the surface of this formation or within sandy lenses or pockets due to low permeability materials impeding rainfall infiltration. Groundwater levels are expected to be largely within 5 m of ground surface in this domain.

2.3 Surface Water Features

Detailed information on surface water features within the site is presented in the Public Environmental Review (PER) (Coffey, 2015). These features are summarised as follows:

- The major surface water features intercepted by the project footprint included both the Ellen Brook and Bennett Brook catchments. The alignment also intercepts two other minor catchments referred to as Henley Brook and St Leonards Creek catchments.
- Twenty Conservation Category Wetlands (CCWs) occur along the length of the proposal footprint. Seven of the CCW are located within or partially within the proposal footprint. The remaining CCWs are to varying degrees within 75 m of the proposal footprint.

The PER also identified lakes protected by the Environmental Protection (Swan Coastal Plain Lakes) Policy 1992 (EPP Lakes Policy). Three such lakes were identified in the project footprint and another two occur in close proximity (i.e. within 100 m). The Environmental Protection Policy (EPP) Lakes Policy was revoked in November 2015, after the PER was published. The five lakes formerly recognised under the policy correspond with wetlands already identified in the geomorphic Swan Coastal Plain dataset.

2.4 Surface Water Drainage

Drainage across the project area has been categorised into three distinct zones (Figure 3A – Figure 3F):

- **Urban.** This zone lies within a predominantly urbanised landscape with extensive formal drainage systems.
- **P1 zone.** This zone is largely low density land use and is characterised by an interdunal landscape, with limited watercourses present. This zone is largely located within the Priority 1 protection area of the GUWPCA.
- **Palusplain.** This zone has largely been cleared for agriculture and is characterised by a gently sloping plain subject to seasonal inundation and waterlogging associated with a shallow water table. The zone contains numerous small ephemeral streams, wetlands and the major waterway of Ellen Brook.

2.5 Groundwater

Groundwater from the Gngangara Mound is used to support domestic, environmental, recreational, commercial (horticulture and agriculture) and industrial needs. The Gngangara Mound is currently the most significant source of groundwater for the Perth region as well as a vital part of groundwater dependent ecosystems. The project intercepts a number of priority drinking water source areas and well head protection zones of the GUWPCA (see Figure 2) including:

- **Priority 1 area** – areas that are managed to ensure no degradation of the drinking water source occurs. These areas contain the greatest restrictions on land use and activity and aim to avoid all risks to the drinking water source.
- **Priority 3 area** – areas where management of risk to water sources from catchment activities are targeted. These are principally areas where existing land use co-exists with water supply sources.
- **Eight Wellhead Protection Zones (WHPZ)** – circular zones established around groundwater production wells to protect drinking water sources from contamination. In Priority 1 areas WHPZ have a radius of 500 m, in Priority 2 and 3 areas the radius is 300 m. Special conditions, such as restrictions on storage and use of chemicals, may apply within these zones (DOW, 2006).

2.6 Groundwater Flow Direction

Across the majority of the proposal footprint groundwater flow is from the Gngangara Mound in an easterly to southerly direction with groundwater discharging into Ellen Brook to the east or the Swan River to the south. However, in the northern section within Hydrogeological Domain 3 groundwater generally flows from the Perth Hills and Darling Scarp in a southwest direction with discharge into Ellen Brook (Golder, 2014).

2.7 Threatened and Priority Ecological Communities and Threatened Flora

A number of Threatened Ecological Communities (TECs), Priority Ecological Communities (PECs) and Threatened flora species are in the vicinity of the project (Figure 4A – 4F) as discussed below:

- 
1. The alignment is located adjacent to a number of occurrences of Swan Coastal Plain (SCP) Mound Springs, a Commonwealth and State listed TEC also known as Tumulus Mound Springs. The SCP Mound Springs TEC is characterised by continuous discharge of groundwater in raised areas of peat, which provide a stable, permanently moist series of microhabitats.
 2. The Critically Endangered Claypans of the SCP TEC was found located adjacent to Great Northern Highway, adjacent to the development envelope.
 3. The Threatened flora species *Darwinia foetida* was found in the Great Northern Highway road reserve at Muchea, adjacent to but not within the proposal footprint. Other records for this species exist about 250 m from the proposal footprint northwest of Neaves Road.
 4. The Critically Endangered Western Swamp Tortoise currently occurs at four locations, two of which (Ellen Brook Nature Reserve and Twin Swamps Nature Reserve) occur within 6 km of the alignment.

2.8 Acid Sulfate Soils

Acid sulfate soils (ASS) are soils that contain iron sulfides, predominantly pyrite. The formation of pyrite requires the presence of iron (naturally available from sediments), sulfur (S) (usually from seawater or sediments of marine origin) and organic matter.

A preliminary investigation into the potential presence of ASS was undertaken in accordance with the guideline Department of Environment Regulation (DER) guideline Identification and Investigation of Acid Sulfate Soils and Acidic Landscapes (DER, 2013).

The potential for ASS occurrence was assessed using a tailored ASS risk mapping process (Figure 5A – Figure 5F). This involved mapping soils within the proposal footprint as having a low, medium or high risk of ASS occurrence, taking into consideration site elevation, geology, groundwater depth and wetland presence and classification, in addition to DER ASS risk mapping.

Preliminary soil sampling also identified that of the seven sites sampled from within areas mapped as high risk of ASS occurrence. Two sampling locations exceeded the DER net acidity criterion of 0.03% S confirming the presence of ASS within the proposal footprint.

Areas of particular concern, in relation to the occurrence of ASS at the site include:

- Watercourse crossings.
- Low-lying areas and wetlands.
- Areas of light grey to grey sands typical of 'Bassendean Sands'.
- Silty or peaty soils.
- Areas containing iron-cemented organic rich sands (coffee rock).

3 DATA QUALITY OBJECTIVES

The scope of works associated with the pre-construction baseline groundwater and surface water survey was undertaken to comply with the Data Quality Objectives (DQO) methodology outlined in the National Environment Protection Council (NEPC) document (NEPC, 2013a). The DQO process provides a systematic planning approach to developing sampling designs for data collection activities that will ultimately support the conclusions and recommendations provided in this report. This process has seven steps, which have been followed in the planning and execution of this investigation, as summarised in Table 3.1 below.

Table 3.1 Groundwater monitoring well construction details

Step 1: State the Problem	
The Problem	Main Roads Western Australia (MRWA) proposes to construct a new 38 km section of the Perth-Darwin National Highway (Swan Valley Section) (Figure 1) between Malaga and Muchea in Western Australia (the proposal). In accordance with Ministerial Statement No. 1036 conditions, 14-3, 14-5 and 14-6 a pre-construction baseline groundwater and surface water survey is required to be undertaken such that trigger and threshold criteria can be established and future project environmental performance can be monitored and measured against key water quality parameters.
Step 2: Identify the goal of the study	
Objective	The objective of this investigation has been defined in Section 1.3.
Step 3: Identify the information inputs	
Media Requiring Assessment	Surface water and groundwater.
Environmental Parameters to be Measured in Each Media	Parameters to be measured are outlined in Table 4.1.
Assessment Criteria	Assessment Criteria are defined in Section 5.
Analytical Methods	Analytical Methods were consistent NATA approved laboratory methodologies. Samples were sent to NATA accredited laboratories. A laboratory quality assurance assessment is provided in Section 9.
Step 4: Define the boundaries of the study	
Investigation Boundary	The boundary of the investigation area was defined as the proposal footprint as seen in Figure 1.
Constraints That May Affect the Assessment	Identified constraints which impeded the investigation included: <ul style="list-style-type: none"> • Weather conditions and seasonal fluctuations at the time of sampling such that sample locations had insufficient water for a sample to be collected. • Access issues to sample locations caused by property owner’s access requirements. • Insufficient data to calculate trigger and threshold values based on a full 24 months’ worth of monitoring data as outlined in ANZECC/ARMCANZ (2000). • Analytical results could be unreliable due to the analysis not being conducted within the short holding times associated with some analytical parameters.

	<ul style="list-style-type: none"> • Condition Environmental Management Plan (CEMP) and Baseline Survey Plan (BSP) developed to help guide the baseline sampling were developed after sampling occurred and may not cover all issues identified in the field. • Limitations associated with sampling methodology of Hydrasleeves. • Monitoring started prior to the completion of the BSP and CEMP. As such, this report may not meet the requirements of the BSP and CEMP. • Laboratories “Limit of Reporting” (LOR) is above the adopt assessment criteria.
Step 5: Develop the analytical approach	
Decision Rules	<p>The decision rules for the project have been based on an analysis of current and future land uses and potential receptors which in turn led to the selection of assessment criteria for the site.</p> <p>If the average or monthly variability of the background data collected exceeds the adopted assessment criteria then site specific assessment criteria will need to be developed in the form of trigger and threshold criteria.</p>
Step 6: Specify performance or acceptance criteria	
Baseline Condition	The baseline condition for the assessment assumes that surface and groundwater conditions are suitable for the proposed land use and are not posing a risk to identified receptors. The baseline condition will be considered true unless data is presented to indicate otherwise.
Decision Errors	<p>The following specifies the decision errors in which incorrect decisions can be made based on data that is not representative of site conditions. As outlined in NEPC (2013a) NEPM Schedule B2 there are two types of decision errors as follows.</p> <ul style="list-style-type: none"> • An insufficient sampling program resulting in the inability to satisfactorily characterise background water quality parameters or the presence of contaminants across the site. • Errors occurring during the collection, handling, preparation and analysis of samples. <p>Consequences of these decision errors will include the following.</p> <ul style="list-style-type: none"> • Incorrect assessment of baseline conditions. • Unrepresentative trigger and threshold criteria. <p>In order to ensure the results are suitably accurate and reproducible for use in the decision-making process, the quality assurance and quality control QA/QC procedures documented in Section 7 have been followed.</p>
Step 7: Develop the plan for obtaining data	
Optimisation of Data	<p>To optimise the data collected during sampling, this investigation was conducted in accordance with NEPC (2013a). Furthermore to ensure the data collected was suitable for interpretation during sample collection the following were adhered to.</p> <ul style="list-style-type: none"> • Optimisation of laboratory LOR to be at or less than the environmental assessment criteria where practicable. • Samples collected using dedicated sampling equipment/containers. • Blind labelled triplicate samples are to be submitted to a secondary laboratory. • QA/QC protocols adhered to.

4 BASELINE SAMPLING AND ANALYSIS PROGRAM

The baseline groundwater and surface water survey commenced in December 2015 and was completed in May 2017. This baseline survey has been conducted in general accordance with the Coffey (2016b) draft Flora and Vegetation – Inland Waters Environmental Quality – Hydrological Processes – Baseline Survey Plan (BSP) (Coffey, 2016b) and the for Flora and Vegetation – Inland Waters Environmental Quality – Hydrological Processes – Condition EMP (CEMP) (Coffey, 2016), (as these reports was developed after monitoring began), designed to meet Ministerial Statement No. 1036 conditions 14-3, 14-5 and 14-6.

4.1 Sampling Method and Parameters

The baseline survey detailed within the following sections has been developed with consideration given to the objectives of the pre-construction baseline surface water and groundwater monitoring program in order to allow for data comparison during the construction and post construction phases of the project.

Surface water and groundwater monitoring is undertaken using regulatory guidance and standards including:

- National Environment Protection Council 1999 (amended 2013) National Environment Protection (Assessment of Site Contamination) Measure (NEPM), Schedule B2: Guideline on Data Collection, Sample Design and Reporting.
- DOW (2009) Field Sampling Guidelines: A guideline for Field Sampling for Surface Water Quality Monitoring Programs.
- Department of Environment and Regulation (DER, 2015) Treatment and Management of Soil and Water in Acid Sulfate Soil Landscapes.
- Department of Environment and Regulation (DER, 2014) Contaminated Sites Guidelines: Assessment and Management of Contaminated Sites.
- Australian Standard AS 5667.1:1998 Water Quality-Sampling – Guidance on the Design of Sampling Programs, Sampling Techniques and the Preservation and Handling of Samples.
- Australian Standard AS 5667.4:1998 Water Quality-Sampling – Guidance on Sampling from Lakes, Natural and Man-made.
- Australian Standard AS 5667.6:1998 Water Quality-Sampling – Guidance on Sampling of Rivers and Streams.
- Australian Standard AS 5667.11:1998 Water Quality-Sampling – Guidance on Sampling of Groundwaters.

Laboratories accredited by the NATA for the analyses undertaken are used to determine concentrations of selected analytical parameters in all cases.

4.1.1 Acid Sulfate Soil Monitoring Requirements

Environmental impacts may occur in ASS areas where excavation and exposure of soils and/or dewatering is proposed. Dewatering or groundwater disturbance in an ASS location (including dewatering discharge) will be managed through a site-specific Acid Sulfate Soil and Dewatering Management Plan (ASSDMP) in accordance with the following:

- Water Quality Protection Note 13 - Dewatering of soils at construction sites (DOW, 2012).

- 
- Treatment and management of soil and water in acid sulfate soil landscapes (DER, 2015).

In accordance with state-based guidelines, a sufficient level of pre-construction ASS assessment will be undertaken where groundwater disturbance activities are proposed to take place in an area with an inadequate level of pre-existing ASS assessment to characterise ASS risk.

4.1.2 Generic Monitoring Requirements

Table 4.1 presents the baseline survey surface water and groundwater parameters selected for laboratory analysis, the results of which will be used to develop trigger and threshold levels.

Table 4.1 Groundwater and surface water parameters selected for laboratory analysis

Location	Parameters to be analysed
Groundwater (55 locations)	
Groundwater parameters – during fieldwork monthly	pH, temperature, dissolved oxygen, EC, TDS, Total acidity and alkalinity.
Groundwater parameters – laboratory analysed monthly	<p>Physical parameters: pH (Lab); EC (lab); TDS; Turbidity</p> <p>Major anions and cations: Hardness as CaCO₃; Alkalinity (Bicarbonate as CaCO₃); Alkalinity (Carbonate as CaCO₃); Alkalinity (Hydroxide) as CaCO₃; Alkalinity (total) as CaCO₃; Acidity as CaCO₃; Sulfate; Chloride; Calcium; Magnesium; Potassium; Sodium; Anions Total; Cations Total; Ionic Balance Total acidity and total alkalinity.</p> <p>Metals: 12 dissolved and total metals (Al, As, Cd, Cr, Cu, Fe, Pb, Mn, Hg, Ni, Se, Zn).</p> <p>Nutrients: Total Nitrogen (TN), NO₃ (Nitrate), NO₂ (Nitrite), NH₃ as N (Ammonia), Total P (Total Phosphorus) and Filterable Reactive Phosphorus (FRP), Oxidised Nitrogen (NO_x).</p>
Groundwater extended laboratory analysis (one monitoring round only)	Total recoverable hydrocarbons (TRH): benzene, toluene, ethylbenzene, xylene (BTEX) – all locations. TRH/BTEX will be sampled for at all locations during one monitoring round in order to gather baseline data. Given the absence of a source potentially contributing hydrocarbon contamination to groundwater (with the exception of Sims Metals), TPH/BTEX is not considered a priority chemical of potential concern. However, during the construction phase monitoring, comparisons to these parameters may be required (e.g. in the event of a fuel leak/spill).
Surface water (22 Locations)*	
Surface water parameters – during fieldwork monthly	pH, temperature, dissolved oxygen, EC, TDS, Total acidity and alkalinity.
Surface water parameters – laboratory analysed monthly	<p>Physical parameters: pH (Lab); EC (lab); TDS; Turbidity</p> <p>Major anions and cations: Hardness as CaCO₃; Alkalinity (Bicarbonate as CaCO₃); Alkalinity (Carbonate as CaCO₃); Alkalinity (Hydroxide) as CaCO₃; Alkalinity (total) as CaCO₃; Acidity as CaCO₃; Sulfate; Chloride; Calcium; Magnesium; Potassium; Sodium; Anions Total; Cations Total; Ionic Balance; Total acidity and total alkalinity.</p> <p>Metals: 12 dissolved and total metals (Al, As, Cd, Cr, Cu, Fe, Pb, Mn, Hg, Ni, Se, Zn).</p> <p>Nutrients: Total Nitrogen (TN), NO₃ (Nitrate), NO₂ (Nitrite), NH₃ as N (Ammonia), Total P (Total Phosphorus) and FRP, Oxidised Nitrogen (NO_x).</p> <p>Bacteria: (Thermotolerant bacteria, <i>E. coli</i>).</p>
Surface water extended laboratory analysis (one monitoring round only)	TRH, BTEX – all locations. TRH/BTEX will be sampled for at all locations during one monitoring round in order to gather baseline data. Given the absence of a source possibly contributing hydrocarbon contamination to surface waters and based on field evidence TPH/BTEX is not considered a priority chemical of potential concern, however, during the construction phase monitoring of these parameters may be required (e.g. in the event of a fuel leak/spill).

* To ensure a representative and comparable baseline dataset, three surface water samples were collected from each wetland sampling location.

5 ASSESSMENT CRITERIA

The adoption of assessment criteria used to assess baseline conditions of both surface water and groundwater along the proposal footprint varies with respect to the key receiving environments and sensitivity of receptors. In alignment with Ministerial Statement No. 1036 the baseline survey groups have been separated into the following categories along the proposal footprint as follows:

- **Sampling Group Aquatic (freshwater/groundwater dependant) ecosystems:** includes CCWs (high conservation value) and TECs (including *Darwinia foetida*, Claypans of the Swan Coastal Plain, Communities of Tumulus Springs (Organic Mound Springs, Swan Coastal Plain)).
- **Sampling Group GUWPCA and Ellen Brook:** includes Priority 1 and Priority 3 Drinking Water Source Areas and Wellhead Protection Zones, surface water features within Ellen Brook and Chandala Brook.

As mentioned in Section 1.1, this report pertains to the Aquatic ecosystems group. Baseline survey locations are spatially distributed within each group to assess baseline water quality with which these receptors are maintained in their undisturbed or current state. As a conservative approach, criteria relevant to the most sensitive receptor associated with a specific location have been used as the initial 'assessment criteria'. The selected assessment criteria along with justification is presented in Section 5.2.

5.1 Sampling Locations

As outlined in both the Flora and Vegetation CEMP and BSP the following groundwater and surface water locations in Table 5.1 have been used to assess the groundwater and surface water conditions within the alignment, to meet the relevant ministerial conditions.

Table 5.1 Aquatic Ecosystem Sampling Locations

Aquatic Ecosystems Sampling Locations
<p>Sampling group Claypans of the Swan Coastal Plain and <i>Darwinia foetida</i></p> <p>MW50, MW51, MW52</p> <p>SWL20</p>
<p>Sampling group Communities of Tumulus Springs</p> <p>MW40, MW41, MW42</p> <p>SWL17</p>
<p>Sampling group CCWs</p> <p>MW1, MW2, MW3, MW4, MW5, MW6, MW10, MW11, MW12, MW26, MW27, MW28, MW29, MW30, MW31, MW32, MW36, MW37, MW38, MW39, MW40, MW41, MW42, MW55</p> <p>SWL1, SWL2, SWL3, SWL4, SWL5, SWL6, SWL7, SWL8, SWL9, SWL10, SWL11, SWL12, SWL13, SWL14, SWL15, SWL16, SWL17</p>

5.2 Assessment Criteria Rationale

The following assessment criteria has been used to evaluate the current groundwater and surface water current conditions.

5.2.1 ANZECC (2000) Fresh water 95% level protection for slightly to moderately disturbed ecosystems

The Australian and New Zealand Environment and Conservation Council and Agriculture and Resource Management Council of Australia and New Zealand Australian Water Quality Guidelines – Fresh water aquatic ecosystem (slightly to moderately disturbed ecosystems) (ANZECC and ARMCANZ, 2000) were considered appropriate to compare the groundwater and surface water quality given *Darwinia foetida* habitat, Claypans of the Swan Coastal Plain, Communities of Tumulus Springs (Organic Mound Springs, Swan Coastal Plain) and CCWs have been affected to a relatively small but measurable degree by human activity (ANZECC and ARMCANZ, 2000). Furthermore the surface water catchments for Claypans of the Swan Coastal Plain, Communities of Tumulus Springs (Organic Mound Springs, Swan Coastal Plain) and CCWs include areas receiving runoff from land disturbed to varying degrees by pastoralism (ANZECC and ARMCANZ, 2000). The population of *Darwinia foetida* within the proposal footprint is located on the existing road reserve for Great Northern Highway and conservatively considered a moderately disturbed system. This rationale applies to all sample locations.

5.2.2 ANZECC (2000) Lowland River default levels for slightly to moderately disturbed ecosystems

The lowland river criteria presented in Tables 3.3.6 – 3.3.7 of ANZECC and ARMCANZ (2000) has been adopted and applies to surface water locations. The lowland river criteria is considered appropriate as upland rivers are defined as those at >150 m altitude. Using the groundwater monitoring well surveyed co-ordinates as a general guide the road development envelope is < 150 m altitude. Monitoring wells relevant altitude is presented in Appendix A.

5.2.3 DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

As mentioned in Section 2.8, the proposed pipeline corridor is subject to areas of high and moderate risks scores of ASS and as such the adopted guideline applies to all sample locations.

Oxidation of potential ASS materials either naturally, or as a result of construction activities may be occurring if groundwater monitoring fails to meet the criteria presented below in Table 5.2. Exceedance of these criteria indicates that groundwater acidification is occurring, or has already occurred, and the implementation of contingency measures should be undertaken.

Table 5.2 Groundwater acidification trigger levels

Analyte	Trigger level
pH	<6
Total Acidity	>40 mg/L
Total Alkalinity	<60 mg/L
Alkalinity:sulfate ratio	< 5; or 1 unit less baseline values.
Sulfate:chloride ratio	> 0.5
Acidity:alkalinity ratio	>1.0
Dissolved aluminium	> 1 mg/L; or 25% higher than baseline values
Dissolved Iron	> 1 mg/L; or 25% higher than baseline values

6 FIELD ACTIVITIES AND SAMPLING METHODOLOGIES

6.1 Groundwater Well Installation

A total of 54 groundwater monitoring wells were installed along the proposal footprint between 4 January 2016 and 22 January 2016 to assess specific hydrogeological regimes along the proposed project alignment. Monitoring wells were installed in locations along the alignment where excavation and dewatering programs are likely to disturb the superficial aquifer in the vicinity of ecological receptors, disturb high risk areas of acid sulfate soils (ASS) or where an identified beneficial use of groundwater exists. Table 6.1 details groundwater well installation methodology with groundwater monitoring locations presented on Figures 3A to 3F. Appendix B presents detail on the rationale behind initial sampling strategy planning approach with Appendix A presenting groundwater and surface water survey location coordinates and details regarding individual survey location designation.

Groundwater well installation drill logs along with well construction details are attached in Appendix C.

Table 6.1 Groundwater monitoring well construction details

Activity	Details
Date of field activities	4 – 22 January 2016
Review of service plans	Service plans of the area from 'Dial Before You Dig' were reviewed prior to marking out and clearing sampling locations.
Service location	Service location was organised and supervised by Coffey to clear each soil bore and groundwater monitoring well location. Each location was cleared to 2 mbgs using non-destructive digging (NDD) (where geology allowed) prior to mechanical drilling.
Drilling method	Motorised drilling of soil bores was undertaken by Strataprobe Pty Ltd under the supervision of Coffey using solid auger drilling techniques where geology allowed.
Soil logging	Soil type classifications and descriptions are based on the Unified Soil Classification System (USCS). Drilling logs are included in Appendix C.
Well construction	<p>All monitoring wells were installed using 50 mm diameter Class 18 un-plasticised Polyvinyl Chloride (uPVC) with three metres of slotted screen. Screens were installed to allow 2 m of submerged screen below the standing water level (SWL) and 1 m above. Monitoring wells were installed to a depth of between 5 and 7 mbgs depending on where groundwater was encountered.</p> <p>Each monitoring well was backfilled with gravel to 0.5 m above the slotted screen, above which a 0.5 m long bentonite seal was established with the remainder of the hole backfilled with cuttings. Monitoring wells were finished with either a steel monument, or in the case of trafficable areas, a flush-mounted steel gatic cover. Details of individual well installations are shown on the drilling logs in Appendix C.</p>
Well survey	All new groundwater monitoring wells were surveyed for positional co-ordinates to Map Grid of Australia (MGA) and elevation from top of casing to metres above Australian Height Datum (mAHD) by professional surveyors, PGS Hope Pty Ltd. Survey results are included in Appendix A.
Decontamination procedure	Drilling equipment was decontaminated between holes using laboratory grade detergent and scheme water.

Activity	Details
Waste disposal	Soil cuttings generated from the soil investigation were returned to hole. Where surplus soil cuttings were present, cuttings were removed from site by the drilling contractor and disposed of accordingly.

6.2 Groundwater Sampling Methodology

6.2.1 Initial Groundwater Monitoring Bores (Round 1)

A total of 22 existing groundwater monitoring wells were sampled using low flow sampling methodology during the initial round of groundwater monitoring from 14 to 21 December 2015, prior to the installation of the additional monitoring wells described in Section 6.1. During this monitoring round a thorough review of the existing well network (including geographical location, construction details and screen depths) was undertaken. The review determined the existing well network as unsuitable due to inappropriate screen depth (i.e. screens were at a depth where potential 'initial' impact from road construction may not be identified) and as such these monitoring wells were not sampled over the subsequent monitoring events. Due to the differences in depth of the screen and location the results from the initial sampling round are not discussed further within this report.

6.2.2 Groundwater Monitoring Bores

As stated within Section 6.1, a total of 54 monitoring wells were installed for baseline survey purposes, with one pre-existing monitoring well (MW55, previously known as GW5) incorporated into the network. As such, a total of 55 groundwater wells were sampled on a monthly basis from January 2016 to May 2017. Only 27 of the 55 wells make up the study of this report, with 19 monitoring wells making up the study of the Inland Waters Environmental Quality – Hydrological Processes report. The remaining wells have not been used for assessment purposes within either reports. Table 6.2 below details groundwater sampling methodology with groundwater sampling locations presented on Figures 6A to 6F. Calibration certificates are presented in Appendix D.

Table 6.2 Groundwater sampling methodology

Activity	Details
Date of field activities	<p>Round 1: 14 – 21 December 2015</p> <p>Round 2: 27 January – 3 February 2016</p> <p>Round 3: 16 – 23 February 2016</p> <p>Round 4: 15 – 22 March 2016</p> <p>Round 5: 11 – 15 April 2016</p> <p>Round 6: 3 – 9 May 2016</p> <p>Round 7: 21 – 28 June 2016</p> <p>Round 8: 12 – 19 July 2016</p> <p>Round 9: 15 – 25 August 2016</p> <p>Round 10: 20 September – 4 October 2016</p> <p>Round 11: 24 October – 1 November 2016</p> <p>Round 12: 22 November – 28 November 2016</p> <p>Round 13: 13 – 19 December 2016</p> <p>Round 14: 17 – 24 January 2017</p> <p>Round 15: 15 – 21 February 2017</p> <p>Round 16: 13 – 20 March 2017</p> <p>Round 17: 10 – 18 May 2017</p>
Sample locations	<p>Well locations were chosen to cover the development footprint of the project, in order to develop a comprehensive groundwater quality baseline data set, including static water levels, across the development footprint such that future project environmental performance can be monitored.</p> <p>The monitoring sites used for the baseline monitoring survey are shown in Figures 3A to 3F. It is anticipated the monitoring sites used for data collection as part of the baseline program will continue to be used throughout the life of the project, wherever possible.</p>
Well gauging	<p>The groundwater monitoring wells for the first six rounds were gauged using an oil/ water interface probe (IP) to measure the SWL, presence of any LNAPL and end of hole measurements. The IP was decontaminated between each monitoring well. After the initial six rounds it was deemed not necessary to detect presence of any LNAPL as no wells had contributed signs of LNAPL. As such from round seven to 17 an air/ water interface probe (IP) to measure the SWL, presence of any LNAPL and end of hole measurements. The IP was decontaminated between each monitoring well.</p>
Field Water Quality	<p>Water quality parameters (pH, oxidative/reduction potential, DO, temperature and electrical conductivity) were taken at all designated monitoring wells. The water quality meter (SmartTroll) was lowered into the water column of the well after gauging and retrieval of the Hydrasleeve to an approximate depth of 0.5m below water.</p> <p>Calibration certificates for the water quality meter can be found in Appendix D.</p> <p>Field test in the form of total acidity and alkalinity were also undertaken for all monitoring wells with sufficient water and conditions in accordance with the SOP found in Appendix E.</p>

Activity	Details
Sampling method	<p>Hydrasleeves Standard Operating Procedure (SOP) is provided in Appendix F. Collection of QC samples included one intralab duplicate and one interlab duplicate (at a rate of one per twenty samples), collection of one combined field and rinsate blank (one per day of fieldwork) and one transport blank (one per day of fieldwork).</p> <p>Intra and interlab duplicates were sampled via an additional Hydrasleeve below the primary Hydrasleeve in dedicated monitoring wells. The water obtained from the Hydrasleeves were mixed to ensure a representative sample was taken.</p>
Decontamination procedure	<p>All non-disposable sampling equipment (IP and water quality meter) were decontaminated with laboratory grade detergent and rinsed with scheme water between wells. Dedicated nitrile gloves and disposable Hydrasleeves were used for each sample location.</p>
Sample preservation	<p>Samples were collected in laboratory supplied bottles containing appropriate preservatives and immediately stored in an insulated cooler chilled with ice upon sampling and ice bricks during air freight to the laboratory. Samples collected for analysis of metals were lab filtered (0.45 µm). Samples were submitted to the National Association of Testing Authorities (NATA) accredited laboratory accompanied by chain of custody (COC) documentation which is included in Appendix G. Analytical laboratory results can be found in Appendix H.</p>
Waste disposal	<p>Groundwater recovered during the purging of monitoring wells was returned to ground.</p>

6.3 Surface Water Sampling Methodology

6.3.1 Initial Surface Water Monitoring (Round 1 and 2)

A total of five surface water sample locations were sampled during the initial sampling event (14 to 21 December 2015) and were taken on an opportunistic basis (encountered surface water locations, during the sampling event). During the round two sampling event, the monitoring wells sampled prior to the first event had increased significantly and as such eight sample locations were sampled based on an opportunistic basis.

6.3.2 Surface Water Monitoring (Round 3 to 13)

From monitoring rounds 3 to 13 a total of 21 surface water locations (3 samples taken at each SWL, only 2 at SWL15) were sampled on a monthly basis from December 2015 to May 2017 (depending on presence or absence of water). The 21 surface water locations were selected based a variety of considerations such as:

- Locations where acid sulphate soils are present and may be potentially disturbed;
- Locations where habitat modification is proposed through clearing causing increased sediment loading and increased turbidity within wetlands during construction (stormwater and drainage discharges).
- Locations where fragmentation of hydraulic connectivity may occur; and
- Potential for diminished water quality within wetlands in future where wetlands are fragmented and/or buffer zones reduced (e.g. changes to levels of nutrient, organic compounds, suspended solids, toxic compounds and salinity).

Table 6.3 details surface water sampling methodology with sampling locations presented on Figures 3A to 3F. Calibration certificates are presented in Appendix D.

6.3.3 Surface Water Monitoring (Round 14)

In response to the OEPA request an additional surface water sample location (SWL22) was included into the monitoring program from round 14 to 17. Only 18 of the 22 surface water locations make up the study of this report, with 3 surface water locations making up the study of the Inland Waters Environmental Quality – Hydrological Processes report. The remaining wells have not been used for assessment purposes within either reports.

Table 6.3 Surface water sampling methodology

Activity	Details
Date of field activities	<p>Round 1: 14 – 21 December 2015</p> <p>Round 2: 27 January – 3 February 2016</p> <p>Round 3: 16 – 23 February 2016</p> <p>Round 4: 15 – 22 March 2016</p> <p>Round 5: 11 – 15 April 2016</p> <p>Round 6: 3 – 9 May 2016</p> <p>Round 7: 21 – 28 June 2016</p> <p>Round 8: 12 – 19 July 2016</p> <p>Round 9: 15 – 25 August 2016</p> <p>Round 10: 20 September – 4 October 2016</p> <p>Round 11: 24 October – 1 November 2016</p> <p>Round 12: 22 November – 28 November 2016</p> <p>Round 13: 13 – 19 December 2016</p> <p>Round 14: 17 – 24 January 2017</p> <p>Round 15: 15 – 21 February 2017</p> <p>Round 16: 13 – 20 March 2017</p> <p>Round 17: 10 – 18 May 2017</p>
Sampling locations	<p>Surface water sampling locations were chosen to cover the development footprint of the project, in order to develop a comprehensive surface water quality baseline data set, across the development footprint such that future project environmental performance can be monitored.</p> <p>To ensure a representative and comparable baseline dataset is collected from within surface waters, three samples from each sampling location was taken, with the exception of SWL15 in which only two were taken.</p> <p>The monitoring sites used for the baseline monitoring survey are shown in Figures 3A to 3F. It is anticipated the monitoring sites used for data collection as part of the baseline program will continue to be used throughout the life of the project, wherever possible.</p> <p>Although not officially surveyed, GPS locations of the surface water locations were taken in the field using a Garmin GPSmap 62s, and can be found in Appendix A along with the survey results of the monitoring well locations.</p>

Activity	Details
Field Water Quality	<p>Water quality parameters (pH, oxidative/reduction potential, DO, temperature and electrical conductivity) were taken at all designated sampling locations. The water quality meter (SmartTroll) was lowered gently into the surface water to an approximate depth of 0.15m (where possible).</p> <p>Calibration certificates for the water quality meter can be found in Appendix D.</p> <p>Field test in the form of total acidity and alkalinity were also undertaken for all monitoring locations with sufficient water and conditions in accordance with the SOP found in Appendix E.</p>
Sampling method	<p>Surface water sampling was undertaken using a sampling pole with attached dedicated container to collect samples from the centre of each lake. The bottle was immersed to a depth of approximately 15 cm (where possible), laying it flat with its mouth towards the flow of the water. Water was then decanted directly into laboratory supplied sample containers. Note: for metal analysis, bottles were not rinsed and were filled by decanting from another, rinsed bottle.</p>
Decontamination procedure	<p>Water monitoring equipment such as the multi parameter water meter was rinsed with DI water between sample locations. The sample containers used with the sample pole were replaced between sampling locations to prevent cross contamination. Dedicated disposable nitrile gloves were used during the collection of each sample.</p>
Sample preservation	<p>Samples were collected in laboratory supplied bottles containing appropriate preservatives and immediately stored in an insulated cooler chilled with ice upon sampling and ice bricks during air freight to the laboratory. Samples collected for analysis of metals were lab filtered using 0.45 µm filters. Samples were submitted to the National Association of Testing Authorities (NATA) accredited laboratory accompanied by chain of custody (COC) documentation which is included in Appendix G. Analytical laboratory results can be found in Appendix H.</p>
Waste disposal	<p>Surface water samples taken for field water quality analysis were returned to each location after sampling.</p>

6.4 Laboratory Analysis

The laboratories used for this investigation were MGT Eurofins (MGT) and ALS Global (ALS), which are NATA registered laboratories for the specified analyses. MGT was used as the primary laboratory where all primary, duplicates, combined rinsate and field blanks and transport blanks were analysed. ALS was used as the secondary ('check') laboratory where all triplicate samples were analysed. Analytical schedules are summarised in Table 4.1.

7 SITE-SPECIFIC GEOLOGY AND HYDROGEOLOGY

7.1 Alignment Geology

A significant geotechnical and hydrogeological site investigation has been completed as part of the NorthLink WA project. The study included drilling and installation of monitoring wells and single well hydraulic (slug) testing (Coffey, 2015). The investigation indicated:

- Geological Domains 1 and 2 were found to have similar composition with Bassendean Sand overlying sandy Guildford Formation.
- Geological Domain 3 was found, as expected, to consist mainly of clay and sand-dominated Guildford Formation underlying either a thin layer of Bassendean Sand or colluvial sand. The clay-dominated Guildford Formation was generally found to exist above the sand-dominated Guildford Formation.

Given the size and variability of activities undertaken at the site, it should be noted that the observed geology was highly variable across the site, specifically in relation to the content of fill material used. The local geology encountered during the January 2016 drilling program is largely consistent with the regional geology detailed above.

7.2 Hydrogeology

Groundwater gauging data collected during field activities has been presented in Table 1. Site-specific hydrogeological information is summarised in Table 7.2 based on the Aquatic Ecosystem groundwater monitoring wells. Groundwater levels in mAHD (derived from static water levels) for each monitoring well and monitoring round have been presented in Graphs 1-7. Considering the data set associated with round 1 did not include the additional wells, the associated data has not been included in Table 7.2.

Table 7.2 Hydrogeological and local groundwater regime

Item	Description
Depth to groundwater	<p>Round 5 (Post Summer 2016)</p> <p>SWLs recorded in April ranged from 0.052 mTOC (MW42) to 7.405 mTOC (MW30). Corrected water elevations ranged between 27.084 mAHD (MW1) to 55.305 mAHD (MW42).</p> <p>Round 11 (Post Winter 2016)</p> <p>SWLs recorded in October ranged from 0.470 mTOC (MW42) to 6.662 mTOC (MW30). Corrected water elevations ranged between 27.830 mAHD (MW3) to 54.890 mAHD (MW42).</p> <p>Round 17 (Post Summer 2017)</p> <p>SWLs recorded in April ranged from 0.630 mTOC (MW42) to 6.995 mTOC (MW30). Corrected water elevations ranged between 27.585 mAHD (MW3) to 54.730 mAHD (MW42).</p>
Groundwater occurrence	Groundwater investigated beneath the site is present within a shallow unconfined sandy aquifer situated within Bassendean Sands comprising a sub-group of the Leederville Formation (Davidson, 1995).

Item	Description
Gradient and groundwater flow direction	Regional groundwater flow is inferred to be to the east within the southern portion of the alignment and through the Gngara Mound and to the southwest in the northern portion of the alignment. Gauging data collected during baseline survey indicates that locally along the alignment groundwater flow direction is predominantly to the south, south-east. Figures 7 to 9 present groundwater contours across the site during the post winter and summer events.
Groundwater discharge location	Groundwater is likely to discharge to local waterways (i.e. Ellen Brook) and wetland systems prior to entering the Swan-Avon River.
Phase separated hydrocarbons (PSH) and LNAPL	PSH and LNAPL were not encountered during the investigation.
Hydraulic conductivity	Based on the observed lithology/hydraulic conductivity estimates (Davidson, 1995) the estimated hydraulic conductivity (K) beneath the site is approximately 8.2 m/day (fine to medium grained SAND) to 4 m/day (Silty SAND).
Effective porosity	Based on typical lithology/effective porosity estimates (Kruseman and de Ridder, 1991), the effective porosity (σ) beneath the site is approximately 0.23 (fine SAND).

7.2.1 Surface Water Field Parameters

Surface water quality parameters were measured during field activities during the 17 monitoring rounds are presented in Table 2. Surface water sampling locations were refined between monitoring rounds two and three with sampling locations presented on Figures 3A to 3F. Surface water quality data is summarised in Appendix J.

7.2.2 Groundwater Field Parameters

Groundwater quality parameters were measured during field activities conducted during the baseline survey are presented in Table 1 for all monitoring. Groundwater quality data is summarised in Appendix J.

8 LABORATORY ANALYTICAL RESULTS

Seventeen monitoring rounds have been conducted as part of the baseline monitoring program. However, groundwater samples collected from Round 1 have not been included in the overall dataset due to the monitoring wells having inappropriate well screening levels and therefore these groundwater wells were not monitored again over the course of the program and not discussed further within this report.

As discussed previously, 27 of the original monitoring wells have been used for the baseline assessment along with 19 of the original surface water locations. Seventeen events have been undertaken at the adopted locations (depending on presence of water). The analysis water quality parameters and analytical results has been undertaken primarily for the purpose of characterising baseline groundwater and surface water geochemistry and to allow identification of potential ASS disturbance through construction activities.

Samples collected during the monitoring rounds were sent to NATA accredited laboratories for analysis of the parameters specified in Section 5.2. Supporting COC documentation is presented in Appendix G and laboratory certificates of analysis attached in Appendix H. Groundwater analytical results screened against the adopted criteria can be found in Tables 3 to 10 and surface water analytical results screened against the adopted criteria can be found in Tables 11 to 14. Key results have been plotted to assess trends and are presented in Appendix I in Graphs 1 – 92.

A review of laboratory analytical results exceeding the adopted ILs can was undertaken and due to the large size of the overall data set the exceedances have been summarised in Appendix J.

9 QUALITY CONTROL & QUALITY ASSURANCE

9.1 Field Method Validation

A summary of field method validation undertaken during the investigation is detailed in Table 9.1 below.

Table 9.1 Field Method Validation

Requirement	Yes/ No	Comments
Decontamination of equipment	Yes	All sampling equipment that was not disposable (IP and water quality meter) were decontaminated between sampling events using laboratory grade phosphate free detergent and rinsed with DI water. Weights and clips associated with the Hydrasleeve sampling train remained in the sampled well, thus no decontamination was required.
Equipment Calibration	Yes	The water quality meter used to undertake field readings was calibrated to factory conditions prior to each sampling event, which was undertaken by a third party.
Sample collection	Yes	Together with decontaminated equipment above, dedicated nitrile gloves and Hydrasleeves, along with new laboratory supplied containers were used during sampling. When surface water samples were collected dedicated sample containers were used.
Sample preservation	Yes	All samples were preserved correctly and stored in insulated coolers prior to arrival at the laboratory. Laboratory SRN indicate that all samples were on a 'cool-down-cycle' upon receipt.
Waste disposal	Yes	Water samples taken for field water quality analysis were returned to each location after sampling.

9.2 Duplicate/ triplicate samples

A blind duplicate and triplicate sample was collected per 20 primary samples during the investigation to assess the laboratory precision. The precision measurement is determined using the relative per cent difference (RPD) between the original and duplicate sample results. The RPD is calculated as follows: $[(X1 - X2) / ((X1 + X2)/2)] * 100$.

Generally, it is recommended that RPD is less than 30 per cent (where results are greater than ten times the LOR) to 50 per cent (where results are less than ten times the LOR) (Standards Australia, 2005). The groundwater RPD calculations for this investigation can be found in Tables 15 and 17, with surface water RPD calculations in Tables 18 to 20.

Where RPDs were outside the acceptable range, sampling procedures, laboratory analytical methods and laboratory results were investigated. A detailed review of analytical results with RPD exceedances indicates that all unacceptable results can be attributed to one or more explanations. RPD review can be found in Tables 21 and 22.

In summary, variations were detected between primary samples and field duplicates. The calculated RPD values are not considered to affect the integrity of the results as the highest concentration has been used for interpretation purposes as a conservative approach.

9.3 Field Blanks

One field blank sample was prepared for everyday of sampling. The blank was prepared by passing laboratory supplied deionised water into clean laboratory supplied containers in the field during the investigation. In addition one transport blank was also prepared per a batch of samples. Blank samples were analysed for metals.

A total of 104 field blanks were taken along with 103 transport blanks. The analytical laboratory blank results can be found in Table 23, along with QC Log in Table 24.

A total of 8 blank samples (QC15, QC23, QC24, QC32, QC33, QC252, QC271 and QC329) returned metal concentrations greater than the laboratory LOR. Given the majority of exceedance occurred during round 1 and 2 this can be attributed to a bad batch of DI water. Overall the integrity of blank results indicates that field conditions and transport procedures have not impacted on the integrity of results.

9.4 Laboratory Internal QC Check

The laboratory quality control report also includes a summary of the laboratory in-house quality control definitions and tests. Tests conducted by the laboratory include analysing a duplicate sample and calculated the RPD, analysing a matrix spike and then determine the recovery of the spike and analyse a certified reference material.

A review of the laboratory internal checks per a round of monitoring can be found in Appendix K.

The review found that the laboratory data is of an acceptable quality for interpretation and assessment purposes.

9.5 QA/QC summary

The field method validation and laboratory QA/QC measures employed throughout the assessment have enabled the quality of field sample collection and laboratory analysis procedures to be examined. Based on the above, the data is considered of acceptable quality for interpretation and environmental assessment of the site.

10 DISCUSSION

10.1 Sample Locations

A total of 55 groundwater monitoring wells and 22 surface water locations had been selected as part of the final monitoring program which were monitored on a regular basis for approximately 16 months. The original sampling design was conducted prior to the CEMP and the BSP and as such this report does not cover all sample locations for interpretation purposes. The derived sample locations related to this report can be found in Section 5.1, some of the remaining locations have been used in the Inland Waters Environmental Quality – Hydrological Processes report. The remaining data from sample locations not used for assessment or interpretation purposes can be found in Tables 25 to 42.

10.2 Groundwater Levels

Groundwater levels within the proposal footprint experience a seasonal high following the wet season (around September/October) and are at a seasonal low around April/May (Graphs 1- 7). The extent of seasonal variation depends on the hydraulic conductivity of the geological unit, but generally a seasonal fluctuation of about 2 to 3 m is expected in areas of clay (i.e. Guildford Formation) and about 1 m to 1.5 m in Bassendean Sands (Golder, 2014).

Calculation of groundwater RLs in mAHD has been undertaken to assess groundwater interception levels in relation to proposed infrastructure invert levels along the alignment. Levels range from approximately 27 mAHD at the most southern section of the alignment (MW01) to 55 mAHD at MW42 in the northern portion of the alignment near Muchea within the intersection area of the series of mapped Mound Springs SCP TEC buffer zones.

Groundwater levels measured in MW42 have periodically registered groundwater levels greater than the ground height. The reason for this is identified as the well location intercepting groundwater under pressure within an area of the Mound Springs SCP TEC buffer zones characterised by continuous discharge of groundwater in raised areas of peat and other organic deposits.

Groundwater contouring undertaken along the alignment and determination of groundwater flow direction has been present in Figures 7 to 9 during the post winter and summer events.

10.3 Analytical Groundwater Results

Groundwater trends have been visually graphed for key parameters and can be found in graphs 8 to 70.

10.3.1 Trace Metals and Metalloids

Metal concentrations have been assessed to determine in groundwater conditions and if the release of metal concentrations has occurred as a result of disturbing ASS from excavation or dewatering activities.

All 27 monitoring wells returned average concentrations exceeding the ANZECC Freshwater (95% protection level) for slightly too moderately disturbed wetland ecosystems for total and dissolved Aluminium, with 7 wells also exceeding the DER (2015) criteria for dissolved Aluminium. Maximum concentrations of dissolved Aluminium are identified as being greater than 2 orders of magnitude above the ANZECC criteria and may present the potential for observation of acute toxicity effects to be occurring in wetlands with the potential of groundwater discharge.

Other dissolved metals found to have average concentrations exceeding the adopted ANZECC criteria were Cadmium (MW52), Copper (MW5, MW6, MW10, MW31, MW41 and MW52), Lead (MW11), Nickel (MW52), Selenium (MW52) and Zinc (MW2, MW30, MW38, MW41, MW50 and MW52).

10.3.2 ASS Indicators

ASS indicator parameters provide a measure of waters vulnerability to acidification via disturbance and oxygenation. Typically activities such as dewatering present the mechanism for alterations of groundwater quality to occur and result in acidification and mobilisation of trace metals and metalloids.

pH conditions across the alignment vary between neutral to strongly acidic conditions. 16 of the 27 monitoring wells returned average pH concentrations below the lower DER (2015) criteria of 6, with seven of the 16 wells averaging pH concentrations below 4.5 indicating evidence of acidification.

Twenty of the 27 monitoring wells returned average concentrations below the adopted DER (2015) criteria of 60 mg/L for total Alkalinity, indicating Alkalinity is heavily depleted and has most likely been used in the system to buffer acidification that has occurred historically.

Sulfate concentrations are relatively low however may be attributed to historical acidification depleting sulfide minerals in soil and reducing the volume to be oxidised and converted to sulfate, which readily partitions into groundwater and transported through the groundwater aquifer.

As such, evidence suggests that portions of the alignment are already subject to acidification or groundwater being susceptible to acidification via disturbance and oxygenation from activities such as dewatering. Low pH, alkalinity and acidity concentrations along with low alkalinity ratios and high dissolved Aluminium concentrations are key indicators for historical acidification. Depleted alkalinity along the alignment is indicative of groundwater that is unable to maintain a stable pH range following groundwater table fluctuations.

10.3.3 Nutrients

Nutrient concentrations have been assessed to determine whether land use activities have resulted in elevated concentrations of nitrogen and phosphorus to be present in waters adjacent to the project footprint.

Average Ammoniacal Nitrogen concentrations in groundwater are below the ANZECC Freshwater (95% protection level) however concentrations of Total Nitrogen (13 wells) were elevated above the threshold criteria most likely indicating that a source of inorganic nitrogen is present in the system.

Average total Phosphorous concentrations were detected (4 wells) marginally elevated above the adopted ANZECC Freshwater (95% protection level) of 0.6 mg/L. Average reactive Phosphorous concentrations were above the adopted ANZECC Freshwater (95% protection level) of 0.03 mg/L in all the 27 monitoring wells as the laboratory LOR was higher than the guideline criteria.

10.4 Presence of Surface Water

A total of 18 surface water locations were monitored as part of this report, of which four were not accessible and five which were permanently dry. Surface water levels were affected by seasonal fluctuations. To ensure a representative and comparable baseline dataset is collected from within surface waters, three samples from each sampling location was taken, with the exception of SWL15 in which only two were taken.

10.5 Analytical Surface Water Results

Surface water trends have been visually graphed for key parameters and can be found in graphs 71 to 92.

10.5.1 Trace Metals and Metalloids

Six of the 18 surface water locations returned average concentrations an order of magnitude more than the adopted ANZECC criteria for dissolved aluminium. However, all wells returned dissolved aluminium concentrations below the DER (2015) criteria.

Other dissolved metals found to have average concentrations exceeding the adopted ANZECC criteria were Copper (SWL17-2), Iron (SWL20) and Zinc (SWL1, SWL4, SWL15 and SWL16-3).

Dissolved metals below the adopted criteria for all monitoring wells included Arsenic, Cadmium, Lead, Manganese, Mercury, Nickel and Selenium.

10.5.2 ASS Indicators

pH conditions across the alignment vary between neutral to strongly acidic conditions. SWL (SWL4-1, SWL5-1, SWL15 and SWL17) returned average pH concentrations below the lower adopted ANZECC criteria of 6.5 and the DER (2015) criteria of 6 (with the exception of SWL4-1). SWL15 (a drain) and SWL17 (groundwater released by spring) average pH concentrations below 5 indicating evidence of groundwater acidification.

Average total Alkalinity concentrations were below the adopted DER (2015) criteria of 60 mg/L for the 9 SWLs, and indicate a lower buffering capacity, only one SWL (17) exceeded the adopted DER (2015) criteria for acidity.

10.5.3 Nutrients

Average Ammoniacal Nitrogen concentrations in surface water were below the ANZECC Freshwater (95% protection level) however concentrations of Total Nitrogen (SWL15, SWL16, SWL17 and SWL20) were elevated above the threshold criteria most likely indicating that a source of inorganic nitrogen is present in the system.

Average total Phosphorous concentrations were detected in all surface water bodies (9) with average concentrations exceeding the adopted ANZECC Lowland criteria of 0.065 mg/L (with the exception of SWL1, SWL1-3). Only SWL16 exceeded the ANZECC Freshwater (95% protection level) of 0.6 mg/L.

10.6 Compliance with the baseline survey report

Overall the baseline survey program was conducted in line with the CEMP and BSP. Quality assurance and quality control review indicates the analytical data to be a suitability quality for interpretation purposes and in addition works were carried out by suitably trained environmental scientist who conducted sampling activities in line with relevant guidelines and standards. The 16 sampling events used for assessment purposes (taken on a monthly basis) has allowed for a robust groundwater and surface water baseline dataset, across the proposal footprint.

Although 24 months' worth of data was not collected, to complete trigger and threshold criteria in direct guidance with ANZECC (2000), trigger and threshold rules were able to be developed in general guidance with ANZECC (2000) and still allows the future project environmental performance to be monitored and measured against key parameters. Information detailing how the interim site specific trigger and threshold criteria has been set can be found in Appendix M.

Surface water flows was not considered as part of the works, however has been undertaken an airborne LiDAR survey. These assessments of surface water flow direction and local catchments for each of the environmental values identified have been presented and discussed in the Condition EMP.

10.7 Trigger and Threshold values

As discussed in Section 1.2 the purpose of undertaking the baseline assessment was to determine the water quality along the proposed footprint as seen in Figure 1. Water quality along the footprint varies significantly based on the water quality and analytical data collected, exceeding adopted criteria for both groundwater and surface water in a number of locations. Where water quality parameters and analytical data has exceeded the adopted guidelines, site specific trigger and threshold criteria have been calculated to determine if groundwater quality is degraded during and post construction.

Interim trigger and threshold criteria been developed based on the first 11 month period and are presented within the Draft Flora and Vegetation Environmental Inland Waters Quality – Hydrological Processes – Condition Environmental Management Plan (Coffey, 2016). Upon the completion of this baseline survey report, it is proposed that the interim threshold and trigger criteria are updated.

11 CONCLUSIONS AND RECOMMENDATIONS

MRWA proposes to construct a new 38 km section of the Perth-Darwin National Highway (Swan Valley Section) (see Figure 1) extending between Malaga and Muchea in Western Australia. The project consists of the construction of a dual carriageway highway which will connect the intersection of Tonkin Highway and Reid Highway in the south with Great Northern Highway and Brand Highway in the north.

In November 2015, MRWA commissioned the pre-construction baseline groundwater and surface water quality assessment. Initial works identified critical data gaps within the existing groundwater monitoring network, including the absence of monitoring wells in key locations. To provide adequate coverage of groundwater resources, a suitable groundwater monitoring network was installed in January 2016.

A total of 55 groundwater monitoring bores and 22 surface water locations were monitored as part of the overall program. In alignment with Ministerial Statement No. 1036 the baseline survey groups have been separated into two separate groups with this report focusing on the Aquatic Ecosystems Group.

It is understood that construction of the road started on June 12, 2017.

Sampling and analysis activities were implemented to assess the baseline conditions of groundwater and surface water values along the project alignment and adjacent to sensitive ecological receptors including:

1. The major surface water features intercepted by the project footprint included both the Ellen Brook and Bennett Brook catchments. The alignment also intercepts two other minor catchments referred to as Henley Brook and St Leonards Creek catchments.
2. Twenty CCWs occur along the length of the proposal footprint. Seven of the CCW are located within or partially within the proposal footprint. The remaining CCWs are to varying degrees within 75 m of the proposal footprint.
3. A number of occurrences of Mound Springs SCP adjacent to the project footprint. The Mound Springs SCP TEC is characterised by continuous discharge of groundwater in raised areas of peat, which provide a stable, permanently moist series of microhabitats.
4. The Gngara Mound which is currently the most significant source of groundwater for the Perth region as well as a vital part of groundwater dependent ecosystems. The project intercepts a number of priority areas and protection zones of the GUWPCA including:
 - a) Priority 1 area – areas that are managed to ensure no degradation of the drinking water source occurs. These areas contain the greatest restrictions on land use and activity and aim to avoid all risks to the drinking water source.
 - b) Priority 3 area – areas where management of risk to water sources from catchment activities are targeted. These are principally areas where existing land use co-exists with water supply sources.
 - c) Eight Wellhead Protection Zones (WHPZ) – circular zones established around groundwater production wells to protect drinking water sources from contamination. In Priority 1 areas WHPZ have a radius of 500 m, in Priority 2 and 3 areas the radius is 300 m. Special conditions, such as restrictions on storage and use of chemicals, may apply within these zones (DOW, 2006c).

11.1 Conclusions

Groundwater levels within the proposal footprint experience a seasonal high following the wet season (around September/October) and are at a seasonal low around April/May. Calculation of groundwater RLs in mAHD range from approximately 27 mAHD at the most southern section of the alignment (MW01) to 55 mAHD at MW42.

Groundwater levels measured in MW42 have periodically registered groundwater levels greater than the ground height. The reason for this is identified as the well location intercepting groundwater under pressure within an area of the Mound Springs SCP TEC buffer zones characterised by continuous discharge of groundwater in raised areas of peat and other organic deposits.

Trace metals and metalloids indicate that aluminium, cadmium and zinc are commonly elevated within groundwater resources along the alignment. Surface water bodies are generally buffered from elevated trace metals however exhibit soluble aluminium concentrations in excess of the ANZECC Freshwater (95% protection level) criteria.

Evidence suggests that portions of the alignment are already subject to acidification or groundwater is readily susceptible to acidification via disturbance and oxygenation from activities such as dewatering. Low pH, alkalinity and acidity concentrations along with low alkalinity ratios and high dissolved Aluminium concentrations are key indicators for this. Depleted alkalinity along the alignment is indicative of groundwater that is unable to maintain a stable pH range following groundwater table fluctuations.

Nutrient concentrations indicate that low levels of ammoniacal nitrogen is present however elevated total nitrogen levels indicate a possible source of inorganic nitrogen is present in the system.

Overall the baseline survey program was conducted in line with the CEMP and BSP. Quality assurance and quality control review indicates the analytical data to be a suitability quality for interpretation purposes.

11.2 Recommendations

The following recommendations are made with respect to the baseline surface and groundwater monitoring program:

1. Update the interim site specific trigger and threshold criteria for key water quality parameters to provide a set of assessment levels such that data will include seasonal high and lows and that the future project environmental performance can be monitored and measured against key parameters.

Details relating to determining the site specific trigger and threshold criteria can be found in Appendix M.

Notes:
ID = Identification
mbTOC - metres below top of casing
m = metres
DO = Dissolved oxygen
TDS (mg/l) = EC (mS/cm) x 650. Conversion derived from chemical analysis results (Davidson 1995).

ID = identification
mg/L = milligrams per litre
°C = degrees Celsius

L = litres
mS/cm = milisiemens per centimetre
mV = millivolts

Notes:
 ID = Identification
 mbTOC - metres below top of casing
 m = metres
 DO = Dissolved oxygen
 ** TDS (mg/l) = EC (mS/cm) x 650. Conversion derived from chemical analysis results (Davidson 1995).

ID = identification
 mg/L = milligrams per litre
 °C = degrees Celsius

L = litres
 mS/cm = millisiemens per centimetre
 mV = millivolts

Notes:
 NE = Not Established
 mg/L = Milligrams per litre
 LOR = Limit of reporting
 - = sample not analysed
 IL = Investigation level
 MW = Monitoring well
 µS/cm = Microsiemens per centimetre

Investigation Levels:
 1. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
 2. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result	Values in highlighted cells exceed nominated IL (1)
Result	Values in highlighted cells exceed nominated IL (2)
Result	Values in highlighted cells exceed laboratory LOR

Notes:

NE = Not Established
µg/L = micrograms per litre
LOR = Limit of reporting
- = sample not analysed
IL = Investigation level
MW = Monitoring well

Investigation Levels:

1. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
2. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result Values in highlighted cells exceed nominated IL (1)
Result Values in highlighted cells exceed nominated IL (2)
Result Values in highlighted cells exceed laboratory LOR

Notes:
 NE = Not Established
 mg/L = Milligrams per litre
 LOR = Limit of reporting
 - = sample not analysed
 IL = Investigation level
 SWL = Surface water location
 µS/cm = Microsiemens per centimeter
 NTU = Nephelometric Turbidity Units

Investigation Levels:
 1. ANZECC (2000) Lowland River default trigger levels for physical and chemical stressors for S/W Australia - Slightly disturbed ecosystems
 2. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
 3. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result	Values in highlighted cells exceed nominated IL (1)
Result	Values in highlighted cells exceed nominated IL (2)
Result	Values in highlighted cells exceed nominated IL (3)
Result	Values in highlighted cells exceed laboratory LOR

Notes:
NE = Not Established
mg/L = Milligrams per litre
LOR = Limit of reporting
- = sample not analysed
IL = Investigation level
MW = Monitoring well
µS/cm = Microsiemens per centimeter

Investigation Levels:
1. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
2. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result Values in highlighted cells exceed nominated IL (1)
Result Values in highlighted cells exceed nominated IL (2)
Result Values in highlighted cells exceed laboratory LOR

Notes:

NE = Not Established
mg/L = Milligrams per litre
LOR = Limit of reporting
- = sample not analysed
IL = Investigation level
SWL= Surface water location
µS/cm = Microsiemens per centimetre
NTU = Nephelometric Turbidity Units

Investigation Levels:

1. ANZECC (2000) Lowland River default trigger levels for physical and chemical stressors for S/W Australia - Slightly disturbed ecosystems
2. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
3. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result	Values in highlighted cells exceed nominated IL (1)
Result	Values in highlighted cells exceed nominated IL (2)
Result	Values in highlighted cells exceed nominated IL (3)
Result	Values in highlighted cells exceed laboratory LOR

Notes:
NE = Not Established
mg/L = Milligrams per litre
LOR = Limit of reporting
- = sample not analysed
IL = Investigation level
SWL= Surface water location
µS/cm = Microsiemens per centimetre
NTU = Nephelometric Turbidity Units

Investigation Levels:
1. ANZECC (2000) Lowland River default trigger levels for physical and chemical stressors for S/W Australia - Slightly disturbed ecosystems
2. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
3. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result	Values in highlighted cells exceed nominated IL (1)
Result	Values in highlighted cells exceed nominated IL (2)
Result	Values in highlighted cells exceed nominated IL (3)
Result	Values in highlighted cells exceed laboratory LOR

Notes:
NE = Not Established
mg/L = Milligrams per litre
LOR = Limit of reporting
- = sample not analysed
IL = Investigation level
SWL = Surface water location

Investigation Levels:
1. ANZECC (2000) Lowland River default trigger levels for physical and chemical stressors for SW Australia - Slightly disturbed ecosystems
2. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
3. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result	Values in highlighted cells exceed nominated IL (1)
Result	Values in highlighted cells exceed nominated IL (2)
Result	Values in highlighted cells exceed nominated IL (3)
Result	Values in highlighted cells exceed laboratory LOR

					Copper	67	4	
					Iron	37	2	
					Lead	67	2	
					Nitrate & Nitrite	67	4	
					Phosphate total (P)	199	4	

Explanation Codes:

1. Low analyte concentrations have exaggerated the percentage differences with respect to small total concentration differences. The calculated RPD values are not considered to affect the integrity of the results as both results remain below assessment criteria (where available).
2. RPD results are above the acceptance limit, however both results are above the assessment criteria (where available). Consequently, any variation is unlikely to affect any conclusions drawn from the investigation and the integrity of the results is maintained.
3. RPD results are above the acceptance limit. Only one sample exceeds the assessment criteria. The variation is not considered to impact the overall assessment as the highest concentration has been utilised in the assessment of the results as a conservative approach.
4. Sample variation is exaggerated where only one of the sample pair has been detected. In this instance, the variation is not considered to impact the overall assessment as the highest concentration has been utilised as a conservative approach.
5. RPD results are above the acceptance limit, however both results are less than the assessment criteria (where available). Consequently, any variation is unlikely to affect any conclusions drawn from the investigation and the integrity of the results is maintained.

* Differences in nutrient concentrations between the primary and secondary laboratories could also be attributable to the different analytical techniques employed by the laboratories for these analyses.

Explanation Codes:

1. Low analyte concentrations have exaggerated the percentage differences with respect to small total concentration differences. The calculated RPD values are not considered to affect the integrity of the results as both results remain below assessment criteria (where available).
2. RPD results are above the acceptance limit, however both results are above the assessment criteria (where available). Consequently, any variation is unlikely to affect any conclusions drawn from the investigation and the integrity of the results is maintained.
3. RPD results are above the acceptance limit. Only one sample exceeds the assessment criteria. The variation is not considered to impact the overall assessment as the highest concentration has been utilised in the assessment of the results as a conservative approach.
4. Sample variation is exaggerated where only one of the sample pair has been detected. In this instance, the variation is not considered to impact the overall assessment as the highest concentration has been utilised as a conservative approach.
5. RPD results are above the acceptance limit, however both results are less than the assessment criteria (where available). Consequently, any variation is unlikely to affect any conclusions drawn from the investigation and the integrity of the results is maintained.

* Differences in nutrient concentrations between the primary and secondary laboratories could also be attributable to the different analytical techniques employed by the laboratories for these analyses.

	Acidity (as CaCO3)	50	4				
	Nitrate (as N)	67	4				
	Total Arsenic	86	4				
	Total Chromium	151	4				
	Total Lead	86	4				
	Total Nickel	57	4				
	Total Selenium	181	4				
Total Zinc	113	3					
Dissolved Aluminium	36	2					
Dissolved Arsenic	86	4					
Dissolved Lead	133	4					

Explanation Codes:

1. Low analyte concentrations have exaggerated the percentage differences with respect to small total concentration differences. The calculated RPD values are not considered to affect the integrity of the results as both results remain below assessment criteria (where available).
2. RPD results are above the acceptance limit, with both results also above the assessment criteria (where available). Consequently, any variation is unlikely to affect any conclusions drawn from the investigation and the integrity of the results is maintained.
3. RPD results are above the acceptance limit. Only one sample exceeds the assessment criteria. The variation is not considered to impact the overall assessment as the highest concentration has been utilised in the assessment of the results as a conservative approach.
4. Sample variation is exaggerated where only one of the sample pair has been detected. In this instance, the variation is not considered to impact the overall assessment as the highest concentration has been utilised as a conservative approach.
5. RPD results are above the acceptance limit, however both results are less than the assessment criteria (where available). Consequently, any variation is unlikely to affect any conclusions drawn from the investigation and the integrity of the results is maintained.

* Differences in nutrient concentrations between the primary and secondary laboratories could also be attributed to the different analytical techniques employed by the laboratories for these analyses.

Notes:

ID = identification
mbTOC - metres below top of casing
m = metres
DO = Dissolved oxygen
TDS (mg/l) = EC (mS/cm) x 650. Conversion derived from chemical analysis results (Davidson 1995).

ID = identification
mg/L = milligrams per litre
°C = degrees Celsius

L = litres
mS/cm = millisiemens per centimetre
mV = millivolts

Notes:
 ID = Identification
 mbTOC = metres below top of casing
 m = metres
 DO = Dissolved oxygen
 ** TDS (mg/l) = EC (mS/cm) x 650. Conversion derived from chemical analysis results (Davidson 1995).

ID = identification
 mg/L = milligrams per litre
 °C = degrees Celsius

L = litres
 mS/cm = millisiemens per centimetre
 mV = millivolts

Notes:
 NE = Not Established
 mg/L = Milligrams per litre
 LOR = Limit of reporting
 - = sample not analysed
 IL = Investigation level
 MW = Monitoring well

Investigation Levels:
 1. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
 2. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result Values in highlighted cells exceed nominated IL (1)
Result Values in highlighted cells exceed nominated IL (2)
Result Values in highlighted cells exceed laboratory LOR

Notes:
NE = Not Established
mg/L = Milligrams per litre
LOR = Limit of reporting
- = sample not analysed
IL = Investigation level
MW = Monitoring well

Investigation Levels:
1. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
2. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result	Values in highlighted cells exceed nominated IL (1)
Result	Values in highlighted cells exceed nominated IL (2)
Result	Values in highlighted cells exceed laboratory LOR

Notes:
NE = Not Established
mg/L = Milligrams per litre
LOR = Limit of reporting
- = sample not analysed
IL = Investigation level
MW = Monitoring well

Investigation Levels:
1. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
2. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result Values in highlighted cells exceed nominated IL (1)
Result Values in highlighted cells exceed nominated IL (2)
Result Values in highlighted cells exceed laboratory LOR

Explanation Codes:

1. Low analyte concentrations have exaggerated the percentage differences with respect to small total concentration differences. The calculated RPD values are not considered to affect the integrity of the results as both results remain below assessment criteria (where available).
2. RPD results are above the acceptance limit, however both results are above the assessment criteria (where available). Consequently, any variation is unlikely to affect any conclusions drawn from the investigation and the integrity of the results is maintained.
3. RPD results are above the acceptance limit. Only one sample exceeds the assessment criteria. The variation is not considered to impact the overall assessment as the highest concentration has been utilised in the assessment of the results as a conservative approach.
4. Sample variation is exaggerated where only one of the sample pair has been detected. In this instance, the variation is not considered to impact the overall assessment as the highest concentration has been utilised as a conservative approach.
5. RPD results are above the acceptance limit, however both results are less than the assessment criteria (where available). Consequently, any variation is unlikely to affect any conclusions drawn from the investigation and the integrity of the results is maintained.

* Differences in nutrient concentrations between the primary and secondary laboratories could also be attributable to the different analytical techniques employed by the laboratories for these analyses.

Round	Primary Sample	Sample ID	Duplicate/ Triplicate Sample	Laboratory	Analyte	RPD	Explanation Code

Notes:
 NE = Not Established
 mg/L = Milligrams per litre
 LOR = Limit of reporting
 - = sample not analysed
 IL = Investigation level
 SWL = Surface water location
 µS/cm = Microsiemens per centimeter
 NTU = Nephelometric Turbidity Units

Investigation Levels:
 1. ANZECC (2000) Lowland River default trigger levels for physical and chemical stressors for S/W Australia - Slightly disturbed ecosystems
 2. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
 3. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result	Values in highlighted cells exceed nominated IL (1)
Result	Values in highlighted cells exceed nominated IL (2)
Result	Values in highlighted cells exceed nominated IL (3)
Result	Values in highlighted cells exceed laboratory LOR

Notes:
NE = Not Established
mg/L = Milligrams per litre
LOR = Limit of reporting
- = sample not analysed
IL = Investigation level
SWL = Surface water location
CFU/ml: Colony forming units per millilitre

Investigation Levels:
1. ANZECC (2000) Lowland River default trigger levels for physical and chemical stressors for S/W Australia - Slightly disturbed ecosystems
2. ANZECC (2000) Fresh water 95% level protection - Slightly to moderately disturbed ecosystems
3. DER (2015) Treatment and management of soil and water in acid sulfate soil landscapes

Result	Values in highlighted cells exceed nominated IL (1)
Result	Values in highlighted cells exceed nominated IL (2)
Result	Values in highlighted cells exceed nominated IL (3)
Result	Values in highlighted cells exceed laboratory LOR

					Nitrogen (total)	56	2
					Reactive Phosphorous	67	4

Explanation Codes:

1. Low analyte concentrations have exaggerated the percentage differences with respect to small total concentration differences. The calculated RPD values are not considered to affect the integrity of the results as both results remain below assessment criteria (where available).
 2. RPD results are above the acceptance limit, with both results also above the assessment criteria (where available). Consequently, any variation is unlikely to affect any conclusions drawn from the investigation and the integrity of the results is maintained.
 3. RPD results are above the acceptance limit. Only one sample exceeds the assessment criteria. The variation is not considered to impact the overall assessment as the highest concentration has been utilised in the assessment of the results as a conservative approach.
 4. Sample variation is exaggerated where only one of the sample pair has been detected. In this instance, the variation is not considered to impact the overall assessment as the highest concentration has been utilised as a conservative approach.
 5. RPD results are above the acceptance limit, however both results are less than the assessment criteria (where available). Consequently, any variation is unlikely to affect any conclusions drawn from the investigation and the integrity of the results is maintained.
- * Differences in nutrient concentrations between the primary and secondary laboratories could also be attributed to the different analytical techniques employed by the laboratories for these analyses.

 MGA = Map Grid of Australia

APPENDIX B

Sampling Program Strategy

1 APPROACH

In order to establish a comprehensive and robust sampling strategy, a tiered review and planning approach has been adopted. The tiered approach ensures environmental issues are appropriately considered in the baseline scope development. Key considerations include:

1. Relevant environmental policies, strategies and criteria.
2. Relevant environmental attributes, values and issues of concern.
3. Known environment impact and disturbances from the proposed development.
4. Development of sampling location matrix.

Further detail around each of the above key aspects is provided in the following sections.

2 ENVIRONMENTAL POLICIES, STRATEGIES AND CRITERIA

Relevant guidance was reviewed to establish regulatory management requirements associated with the protection and prevention of environmental features identified in previous studies. The following guidelines are relevant to establishing overarching requirements for the pre-construction baseline ground and surface water assessment:

- The Environmental Protection Authority's (EPA) objectives for hydrological processes and inland waters environmental quality:
 - To maintain the hydrological regimes of groundwater and surface water so that existing and potential uses, including ecosystem maintenance, are protected.
 - To maintain the quality of groundwater and surface water, sediment and biota so that the environmental values, both ecological and social, are protected.
- *Environmental Guidance for Planning and Development, Guidance Statement No. 33* (EPA, 2008) sets out wetlands that are of high conservation significance and require a high level of protection, the following of which are particularly relevant to this proposal:
 - CCWs as identified on Department of Environment and Conservation (DEC)s Geomorphic Wetlands Swan Coastal Plain dataset.
 - Wetlands protected under the Environmental Protection (Swan Coastal Plain Lakes) Policy 1992 (EPP lakes).
 - Wetlands in Perth's Bush Forever sites (Government of Western Australia, 2000b, and updates).
 - Wetlands with significant vegetation, significant flora or habitat that supports significant fauna as accepted by the EPA, for example, TECs, Declared Rare Flora (Threatened flora) and specially protected fauna.

Guidance Statement No. 33 also states a minimum of 50 m buffer distance to maintain ecological processes (EPA 2008).

- *Western Australian Planning Commission (WAPC 2005) Guideline for the Determination of Wetland Buffer Requirements* discusses the recommended separation and/or management distances for category wetlands CCW, REW and MUWs).
- The Department of Water's (DOW) *Better Urban Water Management Guidance Note 7 Managing the hydrology and hydrogeology of water dependent ecosystems in urban development* (DOW, 2008) guideline sets out requirements in undertaking pre- and post-development assessment of water dependant ecosystem to ensure the ecological health of water dependent ecosystems is maintained.

Additionally, consideration has been given to the following guidelines in order to select appropriate monitoring locations and methods for the baseline sampling program:

- Treatment and management of soil and water in acid sulfate soil landscapes (DER, 2015).
- Assessment and management of contaminated sites (DER, 2014).
- Water quality monitoring program design. A guideline for field sampling for surface water quality monitoring programs (DOW, 2009).

3 POTENTIAL ENVIRONMENT IMPACTS

The next phase in developing the sampling methodology involved understanding and taking into consideration potential impacts that will or may occur during the construction process as follows:

- Threatened ecological communities (TECs) present partially within or close to the proposal footprint including:
 - Mound Springs of the Swan Coastal Plain TEC (Mound Springs TEC) – proposal footprint traverses through several buffer zones.
 - The critically endangered Claypans of the Swan Coastal Plain TEC – near to proposal footprint.
 - Several CCWs partially within or close to highway development footprint.
 - Several EPP lakes adjacent to the proposal footprint.
 - The Gngangara groundwater mound and associated Wellhead Protection Zones (WHPZs) around Water Corporation bores.
 - Two major surface water features including Ellen Brook and its catchment and the Bennett Brook catchment.
 - Locations where habitat modification is proposed through clearing causing increased sediment loading and increased turbidity within wetlands during construction (stormwater and drainage discharges).
 - Consideration given to fragmentation of hydraulic connectivity.
 - Locations where ASS may be present and may be potentially disturbed.
 - Lowering of groundwater table due to dewatering or groundwater abstraction creating ASS disturbance and contamination.
 - Lowering of groundwater levels due to potential dewatering and/or groundwater abstraction which may impact on groundwater dependant ecosystems (GDEs).
-

- 
- Potential for diminished water quality within wetlands in future where wetlands are fragmented and/or buffer zones reduced (e.g. changes to levels of nutrient, organic compounds, suspended solids, toxic compounds and salinity).

4 DEVELOPMENT OF SAMPLING LOCATION MATRIX

The guidelines, environmental values and potential impacts identified in the above sections were used as a basis for establishing sampling locations. The following criteria were established and a matrix developed in order to determine the locations for groundwater wells and surface water monitoring:

- EPP Lakes located within and in close proximity to the proposal footprint.
 - TECs located near to or down hydraulic gradient of construction footprint.
 - CCWs and REWs within the proposal footprint (i.e. will be partially cleared or connectivity fragmented).
 - CCWs where the recommended 100 m buffer from the proposal footprint may not be maintained.
 - CCWs within Priority 1 (P1) or Priority 3 (P3) PDWSA.
 - Consideration of general construction activities within P1 and P2 PDWSA.
 - Areas of high and moderate ASS risk.
 - Areas where dewatering may occur during construction.
 - Consideration given to potential radius of groundwater cone of depression during dewatering (i.e. limit radius to < 100 m as recommended within DER's *Treatment and management of soil and water in acid sulfate soil landscapes guidelines* (DER, 2015)).
-

Inland Water Environmental Quality – Hydrological Processes – Baseline Survey Report
 ENAUPERT04483AA
 Initial Monitoring Well Design and Explanation

Baseline survey location ID	Easting (MGA94)	Northing (MGA94)	Group	Comment	Closest Wetland ID	Conservation category	Public drinking water source area	Vegetation condition	Hydrogeological domain	Drainage zone	Preliminary ASS classification
MW1	397,403.43	6,473,775.60	Aquatic Ecosystem	Located down hydraulic gradient of Reid/Tonkin Highway interchange. Reference monitoring location site allow for assessment of off-site background water quality assessment in this general area. Also down hydraulic gradient of potential dewatering location.	N/A	CCW	N/A	N/A	1	Urban zone	N/A
MW2	397,354.23	6,473,985.63	Aquatic Ecosystem	Dewatering location, proposed infiltration basin location.	15028	CCW	No	Pristine to Good	1	Urban zone	High
MW3	397,944.97	6,474,271.66	Aquatic Ecosystem	Near to dewatering location, proposed infiltration basin location.	8447	MUW	No	Excellent to completely degraded	1	Urban zone	High
MW4	397,648.05	6,474,627.07	Aquatic Ecosystem	Located adjacent (north) of CCW 15033 and proposed basin/drain.	15033	CCW	No	Excellent to Very Good	1	Urban zone	High
MW5/MW6	397,524.97	6,475,105.20	Aquatic Ecosystem	Located near to proposed infiltration basin, Bennett Brook tributary	15757	REW	No	Very Good to Completely Degraded	1	P1 zone	High
	397,603.50	6,475,104.40	Aquatic Ecosystem								
MW7	397,653.63	6,476,117.07	GUWPCA	Located adjacent to well head protection zone and proposed basin/drain location	15029	MUW	Priority 1	Degraded to completely degraded	1	P1 zone	High
MW8	397,303.65	6,476,598.35	GUWPCA	Located down hydraulic gradient of MW9			Priority 3				
MW9	397,358.88	6,476,745.25	GUWPCA	Located near to proposed infiltration basin.			Priority 1				
MW10	397,843.23	6,476,618.86	Aquatic Ecosystem	Located adjacent to CCW, within wellhead protection zone	8416	CCW	Priority 1	Good	1	P1 zone	High
MW11/MW12	397,480.44	6,478,283.83	Aquatic Ecosystem	Located within CCW, within wellhead protection zone	15260/8404	CCW	Priority 1	Excellent to Very Good	1	P1 zone	High
	397,604.47	6,478,320.37	Aquatic Ecosystem								
MW13	397,149.65	6,479,329.86	GUWPCA	Located adjacent to proposed infiltration basin location and CCW, within wellhead protection zone.	15260	CCW	Priority 1	Excellent to Very Good	1	P1 zone	High
MW14/MW15	397,457.02	6,479,577.12	GUWPCA	Monitoring wells located within P1 drinking water source area.	N/A	N/A	Priority 1	N/A	1	P1 zone	Moderate
	397224.18	6479718.26	GUWPCA								Moderate

APPENDIX E

Field Tests SOP

HI 3811 Alkalinity Test Kit

Dear Customer,

Thank you for choosing a Hanna Product. Please read the instructions carefully before using the chemical test kit. It will provide you with the necessary information for correct use of the kit.

Remove the chemical test kit from the packing material and examine it carefully to make sure that no damage has occurred during shipping. If there is any noticeable damage, notify your Dealer or the nearest Hanna office immediately.

Each kit is supplied with:

- Phenolphthalein Indicator, 1 bottle (10 mL) with dropper;
- Bromophenol Blue Indicator, 1 bottle (10 mL) with dropper;
- HI 3811-0, 1 bottle (120 mL);
- 2 calibrated vessels (10 and 50 mL);
- 1 calibrated syringe with tip.

Note: Any damaged or defective item must be returned in its original packing materials.

SPECIFICATIONS

Range	0 to 100 mg/L (ppm) CaCO ₃ 0 to 300 mg/L (ppm) CaCO ₃
Smallest Increment	1 mg/L [in the 0-100 mg/L range] 3 mg/L [in the 0-300 mg/L range]
Analysis Method	Acid titration using phenolphthalein and bromophenol blue
Sample Size	5 mL and 15 mL
Number of Tests	110 (average)
Case Dimensions	200x120x60 mm (7.9x4.7x2.4")
Shipping Weight	460 g (17.2 oz.)

ISTR3811RS 07/05

SIGNIFICANCE AND USE

Alkalinity is the quantitative capacity of a water sample to neutralize an acid to a set pH. This measurement is very important in determining the corrosive characteristics of water due primarily to hydroxide, carbonate and bicarbonate ions. Other sources of alkalinity can be from anions that can be hydrolyzed such as phosphates, silicates, borates, fluoride and salts of some organic acids. Alkalinity is critical in the treatments of drinking water, wastewater, boiler & cooling systems and soils. The Hanna Alkalinity Test Kit makes monitoring easy, quick and safe. The compact size gives the user the versatility to use the kit anywhere. The design makes the kit easy to handle and, except for HI 3811-0, practically prevents accidental injury or damage due to spills.

Note: mg/L is equivalent to ppm (parts per million).

CHEMICAL REACTION

Alkalinity can be measured as Phenolphthalein Alkalinity and Total Alkalinity. The Phenolphthalein Alkalinity is determined by neutralizing the sample to a pH of 8.3 using a dilute hydrochloric acid solution, and a phenolphthalein indicator. This process converts hydroxide ions to water, and carbonate ions to bicarbonate ions:

Since bicarbonate ions can be converted to carbonic acid with additional hydrochloric acid, the Phenolphthalein Alkalinity measures total hydroxide ions, but only half of the bicarbonate contribution. To completely convert the carbonate ions, hydrochloric acid is added until the sample's pH is 4.5:

This is known as Total Alkalinity.

INSTRUCTIONS

READ ALL THE INSTRUCTIONS BEFORE USING THE TEST KIT
LOOK AT THE BACK PAGE FOR THE ILLUSTRATED PROCEDURE

Determination of Phenolphthalein Alkalinity

- Remove the cap from the small plastic vessel. Rinse the plastic vessel with water sample, fill to the 5 mL mark and replace the cap.

- Add 1 drop of Phenolphthalein indicator through the cap port, and mix carefully swirling the vessel in tight circles. If the solution remains colorless, record the phenolphthalein alkalinity as zero, and proceed with the procedure for the determination of Total Alkalinity (see below). If the solution is pink or red, proceed to next step.

- Take the titration syringe and push plunger completely into the syringe. Insert tip into HI 3811-0 solution and pull plunger out until the lower edge of the plunger seal is on the 0 mL mark of the syringe.

- Place syringe tip into the cap port of the plastic vessel and slowly add the titration solution dropwise, swirling to mix after each drop. Continue adding titration solution until the solution in the plastic vessel turns colorless.

- Read off the milliliters of titration solution from the syringe scale, and multiply by 300 to obtain mg/L (ppm) CaCO₃.

Determination of Total Alkalinity

- Remove the cap from the plastic vessel. Rinse the plastic vessel with water sample, fill to the 5 mL mark and replace the cap.
- Through the cap port, add 1 drop of Bromophenol blue indicator and mix. If the solution is yellow, then it is

acidic and an acidity test must be carried out (see HI 3820 — Hanna Acidity Test Kit). If the solution is green or blue, then proceed to next step.

- Take the titration syringe and push the plunger completely into the syringe. Insert the tip into HI 3811-0, and pull the plunger out until the lower edge of the plunger seal is on the 0 mL mark of the syringe.
- Place the syringe tip into the cap port of the plastic vessel and slowly add the titration solution dropwise, swirling to mix after each drop. Continue adding titration solution until the solution in the plastic vessel turns yellow.
- Read off the milliliters of titration solution from the syringe scale and multiply by 300 to obtain mg/L (ppm) CaCO₃.

Low Range Determinations

If results are lower than 100 mg/L, the precision of the test can be improved as follows.

- Remove the cap from the large plastic vessel. Rinse the vessel with water sample, fill to the 15 mL mark and replace the cap. Proceed with the test as described before. To obtain the result for both Phenolphthalein and Total Alkalinity multiply the values on the syringe scale by 100.

Note: Push and twist pipet tip onto tapered end of syringe ensuring an air-tight fit.

Remove the chemical test kit from the packing material and examine it carefully to make sure that no damage has occurred during shipping. If there is any noticeable damage, notify your Dealer or the nearest Hanna office immediately.

Each kit is supplied with:

- Dechlorinating reagent, 1 bottle with dropper (10 mL);
- Bromophenol Blue Indicator, 1 bottle with dropper (10 mL);
- Phenolphthalein Indicator, 1 bottle with dropper (10 mL);
- HI 3820-0, 1 bottle (120 mL);
- 2 calibrated vessels (10 and 50 mL);
- 1 calibrated syringe.

Note: Any damaged or defective item must be returned in its original packing materials.

SPECIFICATIONS

Range	0 to 100 mg/L (ppm) CaCO ₃ 0 to 500 mg/L (ppm) CaCO ₃
Smallest Increment	1 mg/L [in the 0-100 mg/L range] 5 mg/L [in the 0-500 mg/L range]
Analysis Method	Base titration using phenolphthalein and bromphenol blue indicators
Sample Size	5 mL and 25 mL
Number of Tests	110 (average)
Case Dimensions	260x120x60 mm (10.2x4.7x2.4")
Shipping Weight	910 g (34.0 oz.)

ISTR3820R2 12/01

SIGNIFICANCE AND USE

Acidity is the quantitative capacity of a water sample to neutralize a base to a set pH. Therefore, the greater acidity, the more potentially corrosive the water. Acidity can be caused by mineral acids, organic acids and carbon dioxide in the form of carbonic acid. Today, our water supplies are becoming more contaminated with corrosive chemicals from industrial dumping or acid rain. Therefore, acidity measurements are an essential monitoring device to define and control pollution in sewers, lakes and rivers. Acidity of water is equally important to monitor in soils and fish farming to maximize the growing environment.

The Hanna Acidity Test Kit is equipped with all you need to determine acidity of water. The kit is quick, easy to use and portable. This makes it practical for field as well as laboratory use. The design makes the kit easy to handle and, except for HI 3820-0, practically prevents accidental injury or damage due to spills.

Note: mg/L is equivalent to ppm (parts per million).

CHEMICAL REACTION

Strong acids (such as mineral acids) and organic acids can contribute to the acidity of a water sample. With the use of diluted sodium hydroxide as the titrant and bromphenol blue or phenolphthalein indicators, the contribution of strong or organic acids can be determined. The measurement of the strong acid contribution to the sample acidity is known as methyl orange acidity. This is carried out by titrating with sodium hydroxide until the solution turns from yellow to green/blue (pH endpoint about 4.5). The total acidity caused by both mineral and organic acids is determined by titrating to an endpoint pH of 8.3, using phenolphthalein as an indicator. This is known as phenolphthalein acidity.

INSTRUCTIONS

READ ALL THE INSTRUCTIONS BEFORE USING THE TEST KIT
LOOK AT THE BACK PAGE FOR THE ILLUSTRATED PROCEDURE

Note: Push and twist pipet tip onto tapered end of syringe ensuring an air tight-fit.

Determination of Methyl Orange Acidity

- Remove the cap from the small plastic vessel. Rinse the vessel with water sample, fill to the 5 mL mark and replace the cap.
- Add 1 drop of Dechlorinating reagent through the cap port and mix by carefully swirling the vessel in tight circles.

x1

x1

- Through the cap port, add 1 drop of Bromophenol Blue

indicator and mix. If the solution is green or blue, then record the methyl orange acidity as zero. Proceed with procedure for the determination of phenolphthalein acidity. If the solution is yellow proceed with the next step.

- Take the titration syringe and push the plunger completely into the syringe. Insert tip into HI 3820-0 solution and pull the plunger out until the lower edge of the plunger seal is on the 0 mL mark of the syringe.
- Place the syringe tip into the cap port of the plastic vessel and slowly add the titration solution drop-wise, swirling to mix after each drop. Continue adding titration solution until the solution in the plastic vessel changes from yellow to green.
- Read off the milliliters of titration solution from the syringe scale and multiply by 500 to obtain mg/L (ppm) CaCO₃.

$$\text{Syringe Scale} \times 500 = \text{mg/L CaCO}_3$$

Determination of Phenolphthalein Acidity

- Remove the cap from the small plastic vessel. Rinse the vessel with water sample, fill to the 5 mL mark and replace the cap.
- Through the cap port, add 1 drop of Phenolphthalein indicator and mix. If the solution turns red or pink,

x1

then the solution is alkaline and an alkalinity test must be carried out (see Hanna Alkalinity Test Kit – HI 3811). If the solution remains colorless, proceed to next step.

- Take the titration syringe and push the plunger completely into the syringe. Insert tip into HI 3820-0 solution and pull the plunger out until the lower edge of the plunger seal is on the 0 mL mark of the syringe.

- Place the syringe tip into the cap port of the plastic vessel and slowly add the titration solution dropwise, swirling to mix after each drop. Continue adding titration solution until the solution in the plastic vessel turns pink.

- Read off the milliliters of titration solution from the syringe scale and multiply by 500 to obtain mg/L (ppm) CaCO₃.

$$\text{Syringe Scale} \times 500 = \text{mg/L CaCO}_3$$

Low Range Determinations

If result is lower than 100 mg/L, the precision of the test can be improved.

- Remove the cap from the large plastic vessel. Rinse the vessel with water sample, fill to the 25 mL mark and replace the cap.
- Proceed with the test as explained for high range measurements.
- To obtain the results for both methyl orange and phenolphthalein acidity, multiply the read off the syringe by 100.

$$\text{Syringe Scale} \times 100 = \text{mg/L CaCO}_3$$

Introduction

The HydraSleeve is classified as a no-purge (passive) grab sampling device, meaning that it is used to collect ground-water samples directly from the screened interval of a well without having to purge the well prior to sample collection. When it is used as described in this Standard Operating Procedure (SOP), the HydraSleeve causes no drawdown in the well (until the sample is withdrawn from the water column) and only minimal disturbance of the water column, because it has a very thin cross section and it displaces very little water (<100 ml) during deployment in the well. The HydraSleeve collects a sample from within the screen only, and it excludes water from any other part of the water column in the well through the use of a self-sealing check valve at the top of the sampler. It is a single-use (disposable) sampler that is not intended for reuse, so there are no decontamination requirements for the sampler itself.

The use of no-purge sampling as a means of collecting representative ground-water samples depends on the natural movement of ground water (under ambient hydraulic head) from the formation adjacent to the well screen through the screen. Robin and Gillham (1987) demonstrated the existence of a dynamic equilibrium between the water in a formation and the water in a well screen installed in that formation, which results in formation-quality water being available in the well screen for sampling at all times. No-purge sampling devices like the HydraSleeve collect this formation-quality water as the sample, under undisturbed (non-pumping) natural flow conditions. Samples collected in this manner generally provide more conservative (i.e., higher concentration) values than samples collected using well-volume purging, and values equivalent to samples collected using low-flow purging and sampling (Parsons, 2005).

Applications of the HydraSleeve

The HydraSleeve can be used to collect representative samples of ground water for all analytes (volatile organic compounds [VOCs], semi-volatile organic compounds [SVOCs], common metals, trace metals, major cations and anions, dissolved gases, total dissolved solids, radionuclides, pesticides, PCBs, explosive compounds, and all other analytical parameters). Designs are available to collect samples from wells from 1” inside diameter and larger. The HydraSleeve can collect samples from wells of any yield, but it is especially well-suited to collecting samples from low-yield wells, where other sampling methods can’t be used reliably because their use results in dewatering of the well screen and alteration of sample chemistry (McAlary and Barker, 1987).

The HydraSleeve can collect samples from wells of any depth, and it can be used for single-event sampling or long-term ground-water monitoring programs. Because of its thin cross section and flexible construction, it can be used in narrow, constricted or damaged wells where rigid sampling devices may not fit. Using multiple HydraSleeves deployed in series along a single suspension line or tether, it is also possible to conduct in-well vertical profiling in wells in which contaminant concentrations are thought to be stratified.

As with all groundwater sampling devices, HydraSleeves should not be used to collect groundwater samples from wells in which separate (non-aqueous) phase hydrocarbons (i.e., gasoline, diesel fuel or jet fuel) are present because of the possibility of incorporating some of the separate-phase hydrocarbon into the sample.

Description of the HydraSleeve

The HydraSleeve (Figure 1) consists of the following basic components:

- A suspension line or tether (A.), attached to the spring clip or directly to the top of the sleeve to deploy the device into and recover the device from the well. Tethers with depth indicators marked in 1-foot intervals are available from the manufacturer.
- A long, flexible, 4-mil thick lay-flat polyethylene sample sleeve (C.) sealed at the bottom (this is the sample chamber), which comes in different sizes, as discussed below with a self-sealing reed-type flexible polyethylene check valve built into the top of the sleeve (B.) to prevent water from entering or exiting the sampler except during sample acquisition.
- A reusable stainless-steel weight with clip (D.), which is attached to the bottom of the sleeve to carry it down the well to its intended depth in the water column. Bottom weights available from the manufacturer are 0.75" OD and are available in three sizes: 5 oz. (2.5" long); 8 oz. (4" long); and 16 oz. (8" long). In lieu of a bottom weight, an optional top weight may be attached to the top of the HydraSleeve to carry it to depth and to compress it at the bottom of the well (not shown in Figure 1);
- A discharge tube that is used to puncture the HydraSleeve after it is recovered from the well so the sample can be decanted into sample bottles (not shown).
- Just above the self-sealing check valve at the top of the sleeve are two holes which provide attachment points for the spring clip and/or suspension line or tether. At the bottom of the sample sleeve are two holes which provide attachment points for the weight clip and weight.

Figure 1. HydraSleeve components.

Note: The sample sleeve and the discharge tube are designed for one-time use and are disposable. The spring clip, weight and weight clip may be reused after thorough cleaning. Suspension cord is generally disposed after one use although, if it is dedicated to the well, it may be reused at the discretion of the sampling personnel.

Selecting the HydraSleeve Size to Meet Site-Specific Sampling Objectives

It is important to understand that each HydraSleeve is able to collect a finite volume of sample because, after the HydraSleeve is deployed, you only get one chance to collect an undisturbed sample. Thus, the volume of sample required to meet your site-specific sampling and analytical requirements will dictate the size of HydraSleeve you need to meet these requirements.

The volume of sample collected by the HydraSleeve varies with the diameter and length of the HydraSleeve. Dimensions and volumes of available HydraSleeve models are detailed in Table 1.

Table 1. Dimensions and volumes of HydraSleeve models.

Diameter	Volume	Length	Lay-Flat Width	Filled Dia.
<i>2-Inch HydraSleeves</i>				
Standard 625-ml HydraSleeve	625 ml	< 30"	2.5"	1.4"
Standard 1-Liter HydraSleeve	1 Liter	38"	3"	1.9"
1-Liter HydraSleeve SS	1 Liter	36"	3"	1.9"
2-Liter HydraSleeve SS	2 Liters	60"	3"	1.9"
<i>4-Inch HydraSleeves</i>				
Standard 1.6-Liter HydraSleeve	1.6 Liters	30"	3.8"	2.3"
Custom 2-Liter HydraSleeve	2 Liters	36"	4"	2.7"

HydraSleeves can be custom-fabricated by the manufacturer in varying diameters and lengths to meet specific volume requirements. HydraSleeves can also be deployed in series (i.e., multiple HydraSleeves attached to one tether) to collect additional sample to meet specific volume requirements, as described below.

If you have questions regarding the availability of sufficient volume of sample to satisfy laboratory requirements for analysis, it is recommended that you contact the laboratory to discuss the minimum volumes needed for each suite of analytes. Laboratories often require only 10% to 25% of the volume they specify to complete analysis for specific suites of analytes, so they can often work with much smaller sample volumes that can easily be supplied by a HydraSleeve.

HydraSleeve Deployment

Information Required Before Deploying a HydraSleeve

Before installing a HydraSleeve in any well, you will need to know the following:

- The inside diameter of the well
- The length of the well screen
- The water level in the well
- The position of the well screen in the well
- The total depth of the well

The inside diameter of the well is used to determine the appropriate HydraSleeve diameter for use in the well. The other information is used to determine the proper placement of the HydraSleeve in the well to collect a representative sample from the screen (see HydraSleeve Placement, below), and to determine the appropriate length of tether to attach to the HydraSleeve to deploy it at the appropriate position in the well.

Most of this information (with the exception of the water level) should be available from the well log; if not, it will have to be collected by some other means. The inside diameter of the well can be measured at the top of the well casing, and the total depth of the well can be measured by sounding the bottom of the well with a weighted tape. The position and length of the well screen may have to be determined using a down-hole camera if a well log is not available. The water level in the well can be measured using any commonly available water-level gauge.

HydraSleeve Placement

The HydraSleeve is designed to collect a sample directly from the well screen, and it fills by pulling it up through the screen a distance equivalent to 1 to 1.5 times its length. This upward motion causes the top check valve to open, which allows the device to fill. To optimize sample recovery, it is recommended that the HydraSleeve be placed in the well so that the bottom weight rests on the bottom of the well and the top of the HydraSleeve is as close to the bottom of the well screen as possible. This should allow the sampler to fill before the top of the device reaches the top of the screen as it is pulled up through the water column, and ensure that only water from the screen is collected as the sample. In short-screen wells, or wells with a short water column, it may be necessary to use a top-weight on the HydraSleeve to compress it in the bottom of the well so that, when it is recovered, it has room to fill before it reaches the top of the screen.

Example

2" ID PVC well, 50' total depth, 10' screen at the bottom of the well, with water level above the screen (the entire screen contains water).

Correct Placement (figure 2): Using a standard HydraSleeve for a 2" well (2.6" flat width/1.5" filled OD x 30" long, 650 ml volume), deploy the sampler so the weight (an 8 oz., 4"-long weight with a 2"-long clip) rests at the bottom of the well. The top of the sleeve is thus set at about 36" above the bottom of the well. When the sampler is recovered, it will be pulled upward approximately 30" to 45" before it is filled; therefore, it is full (and the top check valve closes) at approximately 66" (5 ½ feet) to 81" (6 ¾ feet) above the bottom of the well, which is well before the sampler reaches the top of the screen. In this example, only water from the screen is collected as a sample.

Figure 2. Correct placement of HydraSleeve.

Incorrect Placement (figure 3): If the well screen in this example was only 5' long, and the HydraSleeve was placed as above, it would not fill before the top of the device reached the top of the well screen, so the sample would include water from above the screen, which may not have the same chemistry.

The solution? Deploy the HydraSleeve with a top weight, so that it is collapsed to within 6" to 9" of the bottom of the well. When the HydraSleeve is recovered, it will fill within 39" (3 ¼ feet) to 54" (4 ½ feet) above the bottom of the well, or just before the sampler reaches the top of the screen, so it collects only water from the screen as the sample.

Figure 3. Incorrect placement of HydraSleeve.

This example illustrates one of many types of HydraSleeve placements. More complex placements are discussed in a later section.

Procedures for Sampling with the HydraSleeve

Collecting a ground-water sample with a HydraSleeve is a simple one-person operation.

Note: Before deploying the HydraSleeve in the well, collect the depth-to-water measurement that you will use to determine the preferred position of the HydraSleeve in the well. This measurement may also be used with measurements from other wells to create a ground-water contour map. If necessary, also measure the depth to the bottom of the well to verify actual well depth to confirm your decision on placement of the HydraSleeve in the water column.

Measure the correct amount of tether needed to suspend the HydraSleeve in the well so that the weight will rest on the bottom of the well (or at your preferred position in the well). Make sure to account for the need to leave a few feet of tether at the top of the well to allow recovery of the sleeve

Note: Always wear sterile gloves when handling and discharging the HydraSleeve.

I. Assembling the HydraSleeve

1. Remove the HydraSleeve from its packaging, unfold it, and hold it by its top.
2. Crimp the top of the HydraSleeve by folding the hard polyethylene reinforcing strips at the holes.
3. Attach the spring clip to the holes to ensure that the top will remain open until the sampler is retrieved.
4. Attach the tether to the spring clip by tying a knot in the tether.

Note: Alternatively, attach the tether to one (NOT both) of the holes at the top of the Hydrasleeve by tying a knot in the tether.

5. Fold the flaps with the two holes at the bottom of the HydraSleeve together and slide the weight clip through the holes.
6. Attach a weight to the bottom of the weight clip to ensure that the HydraSleeve will descend to the bottom of the well.

II. Deploying the HydraSleeve

1. Using the tether, carefully lower the HydraSleeve to the bottom of the well, or to your preferred depth in the water column

During installation, hydrostatic pressure in the water column will keep the self-sealing check valve at the top of the HydraSleeve closed, and ensure that it retains its flat, empty profile for an indefinite period prior to recovery.

Note: Make sure that it is not pulled upward at any time during its descent. If the HydraSleeve is pulled upward at a rate greater than 0.5'/second at any time prior to recovery, the top check valve will open and water will enter the HydraSleeve prematurely.

2. Secure the tether at the top of the well by placing the well cap on the top of the well casing and over the tether.

Note: Alternatively, you can tie the tether to a hook on the bottom of the well cap (you will need to leave a few inches of slack in the line to avoid pulling the sampler up as the cap is removed at the next sampling event).

III. Equilibrating the Well

The equilibration time is the time it takes for conditions in the water column (primarily flow dynamics and contaminant distribution) to restabilize after vertical mixing occurs (caused by installation of a sampling device in the well).

- Situation: The HydraSleeve is deployed for the first time or for only one time in a well

The HydraSleeve is very thin in cross section and displaces very little water (<100 ml) during deployment so, unlike most other sampling devices, it does not disturb the water column to the point at which long equilibration times are necessary to ensure recovery of a representative sample.

In most cases, the HydraSleeve can be recovered immediately (with no equilibration time) or within a few hours. In regulatory jurisdictions that impose specific requirements for equilibration times prior to recovery of no-purge sampling devices, these requirements should be followed.

- Situation: The HydraSleeve is being deployed for recovery during a future sampling event

In periodic (i.e., quarterly or semi-annual) sampling programs, the sampler for the current sampling event can be recovered and a new sampler (for the next sampling event)

deployed immediately thereafter, so the new sampler remains in the well until the next sampling event.

Thus, a long equilibration time is ensured and, at the next sampling event, the sampler can be recovered immediately. This means that separate mobilizations, to deploy and then to recover the sampler, are not required. HydraSleeves can be left in a well for an indefinite period of time without concern.

IV. HydraSleeve Recovery and Sample Collection

1. Hold on to the tether while removing the well cap.
2. Secure the tether at the top of the well while maintaining tension on the tether (but without pulling the tether upwards)
3. Measure the water level in the well.
4. In one smooth motion, pull the tether up between 30” to 45” (36” to 54” for the longer HydraSleeve) at a rate of about 1’ per second (or faster).

The motion will open the top check valve and allow the HydraSleeve to fill (it should fill in about 1 to 1.5 times the length of the HydraSleeve). This is analogous to coring the water column in the well from the bottom up.

When the HydraSleeve is full, the top check valve will close. You should begin to feel the weight of the HydraSleeve on the tether and it will begin to displace water. The closed check valve prevents loss of sample and entry of water from zones above the well screen as the HydraSleeve is recovered.

5. Continue pulling the tether upward until the HydraSleeve is at the top of the well.
6. Decant and discard the small volume of water trapped in the Hydrasleeve above the check valve by turning the sleeve over.

V. Sample Collection

Note: Sample collection should be done immediately after the HydraSleeve has been brought to the surface to preserve sample integrity.

1. Remove the discharge tube from its sleeve.
2. Hold the HydraSleeve at the check valve.
3. Puncture the HydraSleeve just below the check valve with the pointed end of the discharge tube
4. Discharge water from the HydraSleeve into your sample containers.

Control the discharge from the HydraSleeve by either raising the bottom of the sleeve, by squeezing it like a tube of toothpaste, or both.

5. Continue filling sample containers until all are full.

Measurement of Field Indicator Parameters

Field indicator parameter measurement is generally done during well purging and sampling to confirm when parameters are stable and sampling can begin. Because no-purge sampling does not require purging, field indicator parameter measurement is not necessary for the purpose of confirming when purging is complete.

If field indicator parameter measurement is required to meet a specific non-purging regulatory requirement, it can be done by taking measurements from water within a HydraSleeve that is not used for collecting a sample to submit for laboratory analysis (i.e., a second HydraSleeve installed in conjunction with the primary sample collection HydraSleeve [see Multiple Sampler Deployment below]).

Alternate Deployment Strategies

Deployment in Wells with Limited Water Columns

For wells in which only a limited water column exists to be sampled, the HydraSleeve can be deployed with an optional top weight instead of a bottom weight, which collapses the HydraSleeve to a very short (approximately 6” to 9”) length, and allows the HydraSleeve to fill in a water column only 36” to 45” in height.

Multiple Sampler Deployment

Multiple sampler deployment in a single well screen can accomplish two purposes:

- It can collect additional sample volume to satisfy site or laboratory-specific sample volume requirements.
- It can accommodate the need for collecting field indicator parameter measurements.
- It can be used to collect samples from multiple intervals in the screen to allow identification of possible contaminant stratification.

It is possible to use up to 3 standard 30” HydraSleeves deployed in series along a single tether to collect samples from a 10’ long well screen without collecting water from the interval above the screen.

The samplers must be attached to the tether at both the top and bottom of the sleeve. Attach the tether at the top with a stainless-steel clip (available from the manufacturer). Attach the tether at the bottom using a cable tie. The samplers must be attached as follows (figure 4):

- The first (attached to the tether as described above, with the weight at the bottom) at the bottom of the screen
- The second attached immediately above the first
- The third (attached the same as the second) immediately above the second

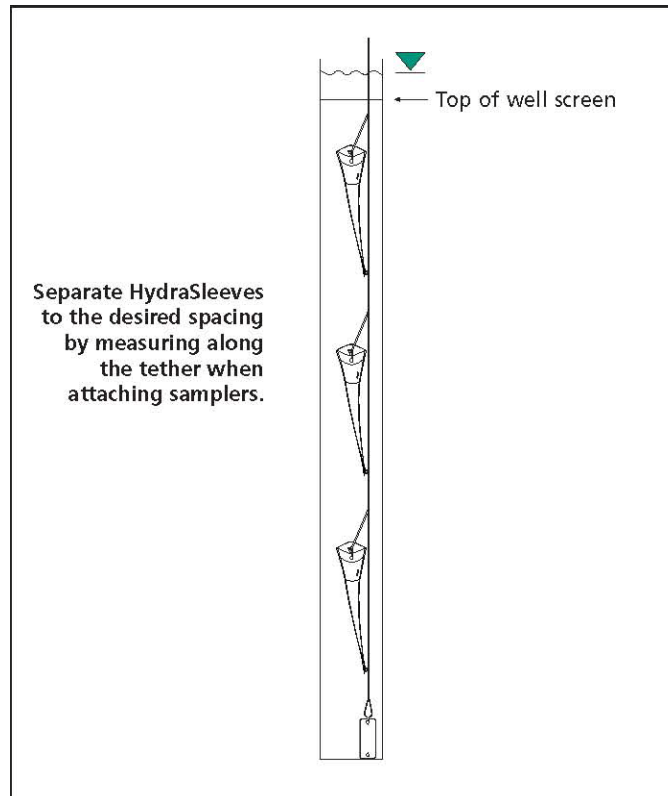

Figure 4. Multiple HydraSleeve deployment.

Alternately, the first sampler can be attached to the tether as described above, a second attached to the bottom of the first using a short length of tether (in place of the weight), and the third attached to the bottom of the second in the same manner, with the weight attached to the bottom of the third sampler (figure 5).

Figure 5. Alternative method for deploying multiple HydraSleeves.

In either case, when attaching multiple HydraSleeves in series, more weight may be required to hold the samplers in place in the well than would be required with a single sampler. Recovery of multiple samplers and collection of samples is done in the same manner as for single sampler deployments.

Post-Sampling Activities

The recovered HydraSleeve and the sample discharge tubing should be disposed as per the solid waste management plan for the site. To prepare for the next sampling event, a new HydraSleeve can be deployed in the well (as described previously) and left in the well until the next sampling event, at which time it can be recovered.

The weight and weight clip can be reused on this sampler after they have been thoroughly cleaned as per the site equipment decontamination plan. The tether may be dedicated to the well and reused or discarded at the discretion of sampling personnel.

Hi Nat,

I have completed the Coffey report that we were discussing.

I am unlikely to be downstairs after morning tea, so please forward additional testing to Anthony.

Thanks,

Stefan

Sampler's Name:	Chris Jowsey	Project Manager:	Richelle Bunbury
Special Instructions:	Nutrients: Total N, NO3, NO2, NH3, Total P and Filterable Reactive Phosphorus (FRP)		
Other Parameters =	pH, conductivity (EC), total dissolved solids (TDS); - Major anions and cations - Na, K, Ca, Mg, Cl, SO4; CO3, HCO3; Total acidity and Total alkalinity;		
	Metals = Al, As, Cd, Cr, Cu, Fe, Pb, Mg, Hg, Ni, Se, Zn (dissolved and total)

Hi Anthony thanks more sediment is mw47

EnviroSampleVIC <EnviroSampleVic@eurofins.com.au> wrote:

Hi Richelle,

We have 2 samples labelled as MW47, but we are missing MW46.

Please advise which is which-see attached.

One has more sediment than the other.

Thanks

Anthony

Importance: High

Hi Richelle,

Please see attached for issues and advise.

Nat-you may need to take photos to help resolve.

Please note these has micro on it so it needs actioning asap.

Anthony

Subject: RE: Coffey issues

Hi Natalie,

On the COC please include MW45 and remove MW48. MW45 will be analysed for the same parameters.

Ill follow up on where abouts SWL15-3 is.

Do we need to add a note on the COC for the laboratory to filter the metals?

Kind Regards
Richelle

Subject: FW: Coffey issues

Hi Richelle,

There are a few issues with the bottles for the NL job – COC attached an issues attached (points 3 and 4). Can you please advise as soon as possible?

Kind regards,

Natalie Krasselt

To: Kelly Jones
Subject: ~~Esky Pick Up~~

Hi Kelly,

~~Can I please have a pick up for 2 eskys. Is ready to go.~~

Also I think from yesterday's batch of **Northlink samples** I may have sent **QC124** and was not on the COC? Please analysis this as per **MW45**.

Please send email confirmation.

Cheers,

Chris Jowsey

Subject: Northlink samples not on CoC - Wednesday 28/9/16

Hi Chris, just letting you know in writing that samples **SWL19-1, SWL19-2, SWL19-3** are **to be added** to the CoC, for same testing as the other **SWL** samples, as per our phone call.

Kind Regards.

Tom Kok
Laboratory / ASM Assistant

Subject: Esky Pick Up

Hi Tom,

Can I please get a esky pick up for Northlink. Is ready to go.

Please send email confirmation.

Cheers,

Chris Jowsey

Subject: RE: missing and extra sample recieved for NL_Baseline GW_SW Monitoring project sampled 24/10/16

Sorry Natalie.

Yes it was swl19 not 20 and the additional monitoring wells 48 and 49. Can they have the same analysis as the other surface water (turbidity and e coli) and monitoring wells (as per other mw samples?)

Subject: missing and extra sample recieved for NL_Baseline GW_SW Monitoring project sampled 24/10/16

Hi Harriet,

In regards to the NL_Baseline GW_SW Monitoring project (COC attached), we received 15 water samples. We did not receive SWL20_1, SWL20_2, SWL20_3, which are listed on the CoC, but we have received samples labelled SWL19_1, SWL19_2, SWL19_3, MW48, MW49 which are not on the CoC. Can you please clarify as soon as possible, if/what analysis you require on samples SWL19_1, SWL19_2, SWL19_3, MW48, MW49?

Kind regards,

Natalie Krasselt

Project Name:	NL_Baseline GW_SW Monitoring	LAB	MGT	Physical Parameters (pH, EC, TDS) Major Anions and Cations Total and dissolved metals Nitrogens - speciated Total Phosphorus Total reactive phosphorus B1 OPP/OCp (trace) Alkalinity 4 -speciated Turbidity E.coli, thermotolerant bacter	NOTES		
Sampler's Name:	Harriet Carter	Project Manager: Richelle Bunbury					
Special Instructions:	Please invoice according to Quote # 151113CEW, total and dissolved metals: Al, As, Cd, Cr, Cu, Fe, Pb, Mn, Ni, Hg, Se, Zn						
Dissolved metals are to be laboratory filtered, Cd LOR to be lowered to 0.00005mg/L							
Major cations and anions: (CO3, HCO3, OH, SO4, Cl, Alkali Metals (Na, Ca, K, Mg), Acidity); Nitrogen speciated: TKN, NH3, NO2, NO3, TN							

Lab No.	Sample ID	Sample Date	Time	Matrix (Soil...etc)	Container Type & Preservative*	T-A-T (specify)	Physical Parameters (pH, EC, TDS)	Major Anions and Cations	Total and dissolved metals	Nitrogens - speciated	Total Phosphorus	Total reactive phosphorus	B1	OPP/OCp (trace)	Alkalinity 4 -speciated	Turbidity	E.coli, thermotolerant bacter

Subject: RE: Eurofins | mgt Sample Receipt Advice - Report 531518 : Site NL_BASELINE GW_SW MONITORING LABORATORY (ENAUPERT04483AA MONITORING EVENT 14)

Hi,

There should not have been any ambers or vials in this esky so please disregard all vials and ambers and place off hold.

Thanks

Kind regards,

Harriet Carter
Environmental Scientist

Subject: Eurofins | mgt Sample Receipt Advice - Report 531518 : Site NL_BASELINE GW_SW MONITORING LABORATORY (ENAUPERT04483AA MONITORING EVENT 14)

Dear Valued Client,

UNABLE TO COMPLETE B1 ON QC297 AS NO AMBER OR VIALS RECEIVED. 4 UNLABELLED TRIP BLANK VIALS RECEIVED AND PLACED ON HOLD

Please find attached a Sample Receipt Advice (SRA), a Summary Sheet and a scanned copy of your Chain-of-Custody (COC). It is important that you check this documentation to ensure that the details are correct such as the Client Job Number, Turn Around Time, any comments in the Notes section and sample numbers as well as the requested analysis. If there are any irregularities then please contact your Eurofins | mgt Analytical Services Manager as soon as possible to make certain that they get changed. Any samples that are received in our lab that have not been scheduled for testing will be charged a fee per sample to cover the supply of the container, handling, storage and disposal as detailed below.

HOLDING FEES

Samples received by Eurofins | mgt and not requested for analysis and require "Hold" will be charged to the client at a cost of \$2.00 per sample.

Hold samples will be stored for a period of 3 months for soils and 3 weeks for water samples. This storage cost will be reimbursed to the Client if analysis is subsequently requested on the sample within 3 months for soils and 3 weeks for water samples.

Regards

Liam Prescott

Attachments: Chain of Custody Form_13.03.2017.xlsx

Hi Cassie,

Please find attached COC for today- also can you please update the two metals bottles labelled QCA and QCB to QC324 and QC325 in the esky?

Thanks
Harriet.

Kind regards,

Harriet Carter

Hi Harriet,

Thanks for sending your samples to us today.

There were some discrepancies in the samples received against the COC attached above.

Samples not received:

SWL22_1 and SWL22_2

Additional Samples received (not on COC):

SWL21_1, SWL21_2 and SWL21_3

Would you like these to be logged as COC (eg. SWL22) or would you like them to be logged as labelled on the bottles?

Kind Regards,

Cassie Hasan

Dear Valued Client,

Please note: Sample MW1 received that was not listed on COC. Please advise if you would like to proceed

with testing.

Please find attached a Sample Receipt Advice (SRA), a Summary Sheet and a scanned copy of your Chain-of-Custody (COC). It is important that you check this documentation to ensure that the details are correct such as the Client Job Number, Turn Around Time, any comments in the Notes section and sample numbers as well as the requested analysis. If there are any irregularities then please contact your Eurofins | mgt Analytical Services Manager as soon as possible to make certain that they get changed.

Please send all reply correspondence to EnviroSampleWA@Eurofins.com noting the Eurofins Lab Reference in the subject header.

Kind regards

Cassie Hasan

Subject: Northlink Baseline samples 11/4/17

Hi Harriet,

Thanks for your samples today. We received the following additional samples that were not listed on the COC:

SWL3-1
SWL3-2
SWL3-3

Please advise if you would like to proceed with analysis for these samples.

Kind Regards,

Cassie Hasan
Laboratory Assistant

APPENDIX H

Laboratory Documentation

Sample Receipt Advice

Company name: **Coffey Environments Pty Ltd WA**
Contact name: **Richelle Bunbury**
Project name: **NORTHLING (NL)**
Project ID: **ENAUPERT04268AA**
COC number: **Not provided**
Turn around time: **5 Day**
Date/Time received: **Dec 15, 2015 8:46 AM**
Eurofins | mgt reference: **483398**

Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- Sample containers for volatile analysis received with zero headspace.
- Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Natalie Krasselt on Phone : (+61) (3) 8564 5000 or by e.mail: NatalieKrasselt@eurofins.com

Results will be delivered electronically via e.mail to Richelle Bunbury - richelle_bunbury@coffey.com.

Certificate of Analysis

Coffey Environments Pty Ltd WA
89-91 Burswood Road
Burswood
WA 6100

NATA Accredited
Accreditation Number 1261
Site Number 1254 & 14271

Accredited for compliance with ISO/IEC 17025.
 The results of the tests, calibrations and/or
 measurements included in this document are traceable
 to Australian/national standards.

Alkali Metals				
Magnesium (filtered)	0.5	mg/L	< 0.5	< 0.5

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Dec 16, 2015	14 Day
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Dec 16, 2015	28 Day
Chloride - Method: MGT 1100A	Melbourne	Dec 16, 2015	28 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Dec 16, 2015	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Dec 16, 2015	7 Day
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Dec 16, 2015	2 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Dec 16, 2015	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Dec 16, 2015	28 Day
Phosphorus filterable reactive (as P) - Method: APHA 4500-P Phosphate (filterable reactive)	Melbourne	Dec 16, 2015	2 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Dec 16, 2015	28 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Dec 16, 2015	7 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Dec 16, 2015	14 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 17, 2015	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 17, 2015	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 17, 2015	28 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Dec 16, 2015	180 Day
Alkali Metals (filtered) - Method: USEPA 6010 Heavy Metals	Melbourne	Dec 16, 2015	180 Day
E.coli - Method: LTM-MIC-6621	Melbourne	Dec 16, 2015	24 Hour
Thermotolerant Coliforms - Method: Inhouse LTM-MIC-6623: Thermotolerant Coliforms by MPN	Melbourne	Dec 16, 2015	24 Hour
Total Nitrogen Set (as N)			
Nitrate & Nitrite (as N) - Method: APHA 4500-NO ₃ /NO ₂ Nitrate-Nitrite Nitrogen by FIA	Melbourne	Dec 16, 2015	28 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Dec 17, 2015	7 Day

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Perth Inorganics, Malaga, WA

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
∅ = ALS is not NATA accredited for these tests.

- Dissolved and total metals conducted by ALS Melbourne, NATA accreditation no. 825, site no 13778
- ED041G (Sulfate Turbidimetric): LOR for sample raised due to possible sample matrix interference.
- TDS by method EA-015 may bias high due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Analysis Holding Time Compliance

Matrix: **WATER**

Method Container / Client Sample ID(s)	Extraction / Preparation			Analysis

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: * = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: * = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by PC Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Conductivity by PC Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of 'filterable' residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM (2013) Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3)
Acidity as Calcium Carbonate	ED038	WATER	In house: Referenced to APHA 2310 B Acidity is determined by titration with a standardised alkali to an end-point pH of 8.3. This method is compliant with NEPM (2013) Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM (2013) Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM (2013) Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45 um filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) Samples are 0.45 um filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH ₃ G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO ₂ - B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite and Nitrate as N (NO _x) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Combined oxidised Nitrogen (NO ₂ +NO ₃) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO ₃ -. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with orthophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Ionic Balance by PCT DA and Turbi SO ₄ DA	EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM (2013) Schedule B(3)
Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	WATER	APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)

Client : COFFEY ENVIRONMENTS PTY LTD
Project : ENAUPERT04268AA Northlink (NL)

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Digestion for Total Recoverable Metals	EN25	WATER	USEPA SW846-3005 Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)

Sample Receipt Advice

Company name: **Coffey Environments Pty Ltd WA**
Contact name: **Richelle Bunbury**
Project name: **NORTHLINK (NL)**
Project ID: **ENAUPERT04268AA**
COC number: **Not provided**
Turn around time: **5 Day**
Date/Time received: **Dec 18, 2015 8:24 AM**
Eurofins | mgt reference: **483996**

Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- Sample containers for volatile analysis received with zero headspace.
- Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Natalie Krasselt on Phone : (+61) (3) 8564 5000 or by e.mail: NatalieKrasselt@eurofins.com

Results will be delivered electronically via e.mail to Richelle Bunbury - richelle_bunbury@coffey.com.

Certificate of Analysis

Coffey Environments Pty Ltd WA
 89-91 Burswood Road
 Burswood
 WA 6100

NATA Accredited
 Accreditation Number 1261
 Site Number 1254

Accredited for compliance with ISO/IEC 17025.
 The results of the tests, calibrations and/or
 measurements included in this document are traceable
 to Australian/national standards.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Dec 21, 2015	14 Day
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Dec 21, 2015	28 Day
Chloride - Method: MGT 1100A	Melbourne	Dec 21, 2015	28 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Dec 21, 2015	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Dec 21, 2015	7 Day
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Dec 21, 2015	2 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Dec 21, 2015	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Dec 18, 2015	28 Day
Phosphorus filterable reactive (as P) - Method: APHA 4500-P Phosphate (filterable reactive)	Melbourne	Dec 21, 2015	2 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Dec 21, 2015	28 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Dec 18, 2015	7 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Dec 21, 2015	14 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 18, 2015	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 18, 2015	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 18, 2015	28 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Dec 18, 2015	180 Day
Alkali Metals (filtered) - Method: USEPA 6010 Heavy Metals	Melbourne	Dec 18, 2015	180 Day
Total Nitrogen Set (as N)			
Nitrate & Nitrite (as N) - Method: APHA 4500-NO ₃ /NO ₂ Nitrate-Nitrite Nitrogen by FIA	Melbourne	Dec 21, 2015	28 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Dec 18, 2015	7 Day

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments
Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
Q19	TDS may bias high due to the presence of fine particulate or colloidal matter that may pass through the filter paper.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

NATA Accredited Laboratory 825

Accredited for compliance with
ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Alini Goundar	Senior Analyst	Perth Microbiology, Malaga, WA
Jeremy Truong	Laboratory Supervisor	Perth Inorganics, Malaga, WA
Scott James	Laboratory Manager	Perth Inorganics, Malaga, WA

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
∅ = ALS is not NATA accredited for these tests.

- EG035F: Poor spike recovery due to high TDS content. Confirmed by re-extraction and re-analysis.
- MW006 is ALS's internal code and is equivalent to AS4276.7.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA Accredited
Laboratory 825

Accredited for
compliance with
ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Alini Goundar	Senior Analyst	Perth Microbiology, Malaga, WA
Jeremy Truong	Laboratory Supervisor	Perth Inorganics, Malaga, WA
Scott James	Laboratory Manager	Perth Inorganics, Malaga, WA

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- **NO** Quality Control Sample Frequency Outliers exist.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
ED045G: Chloride by Discrete Analyser	EP1517276--001	Anonymous	Chloride	16887-00-6	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EG035T: Total Recoverable Mercury by FIMS	EP1517276--003	Anonymous	Mercury	7439-97-6	67.1 %	70-130%	Recovery less than lower data quality objective

Miscellaneous Plastic bottle -unpreserved QC17		----	----	----	22-Dec-2015	21-Dec-2015	1

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by PC Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Conductivity by PC Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of 'filterable' residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM (2013) Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3)
Acidity as Calcium Carbonate	ED038	WATER	In house: Referenced to APHA 2310 B Acidity is determined by titration with a standardised alkali to an end-point pH of 8.3. This method is compliant with NEPM (2013) Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM (2013) Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM (2013) Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45 um filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) Samples are 0.45 um filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH ₃ G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO ₂ - B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite and Nitrate as N (NO _x) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Combined oxidised Nitrogen (NO ₂ +NO ₃) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO ₃ -. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with orthophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Ionic Balance by PCT DA and Turbi SO ₄ DA	EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM (2013) Schedule B(3)
Thermotolerant Coliforms & E.coli by Membrane Filtration	MW006	WATER	In house: Referenced to AS 4276.7 2007
Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	WATER	APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

NATA Accredited Laboratory 825

Accredited for compliance with
ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Canhuang Ke	Metals Instrument Chemist	Perth Inorganics, Malaga, WA
Jeremy Truong	Laboratory Supervisor	Perth Inorganics, Malaga, WA
Rassem Ayoubi	Senior Organic Chemist	Perth Organics, Malaga, WA

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
∅ = ALS is not NATA accredited for these tests.

- EG020: It is recognised that total aluminium is less than dissolved aluminium. However, the difference is within experimental variation of the methods.
- EK61G/EK067G (TKN/TP): LOR raised due to possible sample matrix interference.
- EP075: 'Sum of PAH' is the sum of the USEPA 16 priority PAHs
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g,h,i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA Accredited
Laboratory 825

Accredited for
compliance with
ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Canhuang Ke	Metals Instrument Chemist	Perth Inorganics, Malaga, WA
Jeremy Truong	Laboratory Supervisor	Perth Inorganics, Malaga, WA
Rassem Ayoubi	Senior Organic Chemist	Perth Organics, Malaga, WA

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: EP1517220	Page	: 1 of 10
Client	: COFFEY ENVIRONMENTS PTY LTD	Laboratory	: Environmental Division Perth
Contact	: RICHELLE BUNBURY	Telephone	: 08 9209 7619
Project	: ENAUPERT04268AA Northlink (NL)	Date Samples Received	: 18-Dec-2015
Site	: ----	Issue Date	: 04-Jan-2016
Sampler	: CHRISTOPHER JOWSEY	No. of samples received	: 1
Order number	: ----	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for **VOC in soils** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: * = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: ✘ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)							
Acidity as Calcium Carbonate	ED038	2	20	10.00	10.00	✔	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by PC Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Conductivity by PC Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of 'filterable' residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM (2013) Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3)
Acidity as Calcium Carbonate	ED038	WATER	In house: Referenced to APHA 2310 B Acidity is determined by titration with a standardised alkali to an end-point pH of 8.3. This method is compliant with NEPM (2013) Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM (2013) Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM (2013) Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45 um filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) Samples are 0.45 um filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH ₃ G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO ₂ - B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite and Nitrate as N (NO _x) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Combined oxidised Nitrogen (NO ₂ +NO ₃) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO ₃ -. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with orthophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Ionic Balance by PCT DA and Turbi SO ₄ DA	EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)

<i>Analytical Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
TRH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Semivolatile Organic Compounds	EP075	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
TKN/TP Digestion	EK061/EK067	WATER	APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	USEPA SW846-3005 Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)

Sample Receipt Advice

Company name: **Coffey Environments Pty Ltd WA**
Contact name: **Richelle Bunbury**
Project name: **NORTHLINK (NL)**
Project ID: **ENAUPERT04268AA**
COC number: **04268AA**
Turn around time: **5 Day**
Date/Time received: **Dec 21, 2015 8:09 AM**
Eurofins | mgt reference: **484221**

Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- Sample containers for volatile analysis received with zero headspace.
- Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Natalie Krasselt on Phone : (+61) (3) 8564 5000 or by e.mail: NatalieKrasselt@eurofins.com

Results will be delivered electronically via e.mail to Richelle Bunbury - richelle_bunbury@coffey.com.

Certificate of Analysis

Coffey Environments Pty Ltd WA
89-91 Burswood Road
Burswood
WA 6100

NATA Accredited
Accreditation Number 1261
Site Number 1254

Accredited for compliance with ISO/IEC 17025.
The results of the tests, calibrations and/or
measurements included in this document are traceable
to Australian/national standards.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Semivolatile Organics - Method: USEPA 8270 Semivolatile Organics	Melbourne	Dec 30, 2015	7 Day
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Dec 22, 2015	14 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Dec 22, 2015	28 Day
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Dec 22, 2015	2 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Dec 22, 2015	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Dec 21, 2015	28 Day
Phosphorus filterable reactive (as P) - Method: APHA 4500-P Phosphate (filterable reactive)	Melbourne	Dec 22, 2015	2 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Dec 21, 2015	7 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Dec 22, 2015	14 Day
Major Anions			
Bicarbonate Alkalinity (as CaCO ₃) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Dec 22, 2015	14 Day
Carbonate Alkalinity (as CaCO ₃) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Dec 22, 2015	14 Day
Chloride - Method: MGT 1100A	Melbourne	Dec 22, 2015	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Dec 22, 2015	7 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Dec 22, 2015	28 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 22, 2015	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Jan 05, 2016	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 22, 2015	28 Day
Alkali Metals (filtered) - Method: USEPA 6010 Heavy Metals	Melbourne	Dec 21, 2015	180 Day

Description	Testing Site	Extracted	Holding Time
Ammonia (as N) - Method: APHA 4500-NH3 Ammonia Nitrogen by FIA	Melbourne	Dec 22, 2015	28 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Dec 21, 2015	180 Day
Total Nitrogen Set (as N) Nitrate & Nitrite (as N) - Method: APHA 4500-NO3/NO2 Nitrate-Nitrite Nitrogen by FIA	Melbourne	Dec 22, 2015	28 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Dec 29, 2015	7 Day

Internal Quality Control Review and Glossary

General

- Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
- All soil results are reported on a dry basis, unless otherwise stated.
- Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- Results are uncorrected for matrix spikes or surrogate recoveries.
- SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- Samples were analysed on an 'as received' basis.
- This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

- Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
- Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
- Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
- For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
- Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments
Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Sample Receipt Advice

Company name: **Coffey Environments Pty Ltd WA**
Contact name: **Richelle Bunbury**
Project name: **NORTHLINK (NL)**
Project ID: **ENAUPERT04268AA**
COC number: **Not provided**
Turn around time: **5 Day**
Date/Time received: **Dec 22, 2015 8:43 AM**
Eurofins | mgt reference: **484289**

Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- Sample containers for volatile analysis received with zero headspace.
- Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Natalie Krasselt on Phone : (+61) (3) 8564 5000 or by e.mail: NatalieKrasselt@eurofins.com

Results will be delivered electronically via e.mail to Richelle Bunbury - richelle_bunbury@coffey.com.

Certificate of Analysis

Coffey Environments Pty Ltd WA
89-91 Burswood Road
Burswood
WA 6100

NATA Accredited
Accreditation Number 1261
Site Number 1254 & 14271

Accredited for compliance with ISO/IEC 17025.
The results of the tests, calibrations and/or
measurements included in this document are traceable
to Australian/national standards.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Dec 22, 2015	14 Day
Ammonia (as N) - Method: E036/E050 Ammonia as N	Sydney	Dec 23, 2015	28 Day
Chloride - Method: MGT 1100A	Melbourne	Dec 22, 2015	28 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Dec 22, 2015	28 Day
Nitrate (as N) - Method: E037 /E051 Nitrate as N	Sydney	Dec 23, 2015	7 Day
Nitrite (as N) - Method: E037 /E051 Nitrite as N	Sydney	Dec 23, 2015	2 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Dec 22, 2015	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Dec 22, 2015	28 Day
Phosphorus filterable reactive (as P) - Method: APHA 4500-P Phosphate (filterable reactive)	Melbourne	Dec 22, 2015	2 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Dec 22, 2015	28 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Dec 22, 2015	7 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Dec 22, 2015	14 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 22, 2015	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 22, 2015	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 22, 2015	28 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Dec 22, 2015	180 Day
Alkali Metals (filtered) - Method: USEPA 6010 Heavy Metals	Melbourne	Dec 22, 2015	180 Day
E.coli - Method: LTM-MIC-6621	Melbourne	Dec 22, 2015	24 Hour
Thermotolerant Coliforms - Method: Inhouse LTM-MIC-6623: Thermotolerant Coliforms by MPN	Melbourne	Dec 22, 2015	24 Hour
Total Nitrogen Set (as N)			
Nitrate & Nitrite (as N) - Method: E037 /E051 NO _x (as N)	Sydney	Dec 23, 2015	28 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Dec 29, 2015	7 Day

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments
Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
Q15	The RPD reported passes Eurofins mgt's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.
Q19	TDS may bias high due to the presence of fine particulate or colloidal matter that may pass through the filter paper.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Dec 15, 2015	14 Day
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Dec 15, 2015	28 Day
Chloride - Method: MGT 1100A	Melbourne	Dec 15, 2015	28 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Dec 15, 2015	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Dec 15, 2015	7 Day
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Dec 15, 2015	2 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Dec 15, 2015	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Dec 15, 2015	28 Day
Phosphorus filterable reactive (as P) - Method: APHA 4500-P Phosphate (filterable reactive)	Melbourne	Dec 15, 2015	2 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Dec 15, 2015	28 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Dec 15, 2015	7 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Dec 15, 2015	14 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 15, 2015	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 15, 2015	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Dec 15, 2015	28 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Dec 21, 2015	180 Day
Alkali Metals (filtered) - Method: USEPA 6010 Heavy Metals	Melbourne	Dec 15, 2015	180 Day
Total Nitrogen Set (as N)			
Nitrate & Nitrite (as N) - Method: APHA 4500-NO ₃ /NO ₂ Nitrate-Nitrite Nitrogen by FIA	Melbourne	Dec 15, 2015	28 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Dec 16, 2015	7 Day

Internal Quality Control Review and Glossary

General

- Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
- All soil results are reported on a dry basis, unless otherwise stated.
- Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- Results are uncorrected for matrix spikes or surrogate recoveries.
- SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- Samples were analysed on an 'as received' basis.
- This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

- Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
- Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
- Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
- For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
- Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments
Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	No
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
G01	The LORs have been raised due to matrix interference
Q19	TDS may bias high due to the presence of fine particulate or colloidal matter that may pass through the filter paper.

Eurofins | mgt reference: **486999**

Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- Sample containers for volatile analysis received with zero headspace.
- Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Natalie Krasselt on Phone : (+61) (3) 8564 5000 or by e.mail: NatalieKrasselt@eurofins.com

Results will be delivered electronically via e.mail to Richelle Bunbury - richelle_bunbury@coffey.com.

---	---

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

NATA Accredited Laboratory 825

Accredited for compliance with
ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Canhuang Ke	Metals Instrument Chemist	Perth Inorganics, Malaga, WA
Jeremy Truong	Laboratory Supervisor	Perth Inorganics, Malaga, WA
Shobhna Chandra	Metals Coordinator	Sydney Inorganics, Smithfield, NSW
Vinitha Kesavan	Analyst	Perth Microbiology, Malaga, WA

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
∅ = ALS is not NATA accredited for these tests.

- MW006, estimate (~) is reported where there are many non-target colonies; the typical colonies may be masked by overgrowth of non-target organisms. It may be informative to record this fact.
- MW006 is ALS's internal code and is equivalent to AS4276.7.

Quote number	: ----	No. of samples analysed	: 1

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA Accredited
Laboratory 825

Accredited for
compliance with
ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Canhuang Ke	Metals Instrument Chemist	Perth Inorganics, Malaga, WA
Jeremy Truong	Laboratory Supervisor	Perth Inorganics, Malaga, WA
Shobhna Chandra	Metals Coordinator	Sydney Inorganics, Smithfield, NSW
Vinitha Kesavan	Analyst	Perth Microbiology, Malaga, WA

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: ----	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- **NO** Quality Control Sample Frequency Outliers exist.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: WATER

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EG020T: Total Metals by ICP-MS	EP1600715--001	Anonymous	Nickel	7440-02-0	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EK055G: Ammonia as N by Discrete Analyser	EP1600633--001	Anonymous	Ammonia as N	7664-41-7	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.

Miscellaneous Plastic bottle -unpreserved QC22		----	----	----	01-Feb-2016	28-Jan-2016	4

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: WATER

Evaluation: ✘ = Holding time breach ; ✔ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by PC Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Conductivity by PC Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of 'filterable' residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM (2013) Schedule B(3)
Turbidity	EA045	WATER	In house: Referenced to APHA 2130 B. This method is compliant with NEPM (2013) Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM (2013) Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM (2013) Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Dissolved Metals in Fresh Water -Suite A by ORC-ICPMS	EG094A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020 Samples are 0.45µm filtered prior to analysis. The ORC-ICPMS technique removes interfering species through a series of chemical reactions prior to ion detection. Ions are passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to measurement by a discrete dynode ion detector. This method is compliant with NEPM (2013) Schedule B(3)
Total Metals in Fresh Water -Suite A by ORC-ICPMS	EG094A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020. The ORC-ICPMS technique removes interfering species through a series of chemical reactions prior to ion detection. Ions are passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to measurement by a discrete dynode ion detector. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH ₃ G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO ₂ - B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined separately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite and Nitrate as N (NO _x) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Combined oxidised Nitrogen (NO ₂ +NO ₃) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO ₃ -. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)

<i>Analytical Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with orthophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM (2013) Schedule B(3)
Thermotolerant Coliforms & E.coli by Membrane Filtration	MW006	WATER	In house: Referenced to AS 4276.7 2007
<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Jan 29, 2016	14 Day
Chloride - Method: MGT 1100A	Melbourne	Jan 29, 2016	28 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Jan 29, 2016	28 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Jan 29, 2016	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Jan 28, 2016	28 Day
Phosphorus reactive (as P) - Method: APHA4500-PO4	Melbourne	Jan 29, 2016	2 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Jan 29, 2016	28 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Jan 28, 2016	7 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Feb 02, 2016	14 Day
Nitrogens (speciated)			
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Feb 01, 2016	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Feb 01, 2016	7 Day
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Feb 01, 2016	2 Day
Organic Nitrogen (as N) - Method: APHA 4500 Organic Nitrogen (N)	Melbourne	Feb 01, 2016	7 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Feb 01, 2016	7 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Jan 28, 2016	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Jan 28, 2016	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Jan 28, 2016	28 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Jan 28, 2016	180 Day

Internal Quality Control Review and Glossary

General

- Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
- All soil results are reported on a dry basis, unless otherwise stated.
- Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- Results are uncorrected for matrix spikes or surrogate recoveries.
- SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- Samples were analysed on an 'as received' basis.
- This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

- Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
- Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
- Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments
Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
Q15	The RPD reported passes Eurofins mgt's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.
R14	These results have been confirmed by repeat analysis

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Jan 29, 2016	14 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Jan 29, 2016	28 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Jan 29, 2016	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Jan 29, 2016	28 Day
Phosphorus reactive (as P) - Method: APHA4500-PO4	Melbourne	Jan 29, 2016	2 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Jan 29, 2016	7 Day
Turbidity - Method: LTM-INO-4140 'Turbidity by Nephelometric Method'	Melbourne	Feb 02, 2016	2 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Feb 03, 2016	14 Day
Nitrogens (speciated)			
Nitrite (as N) - Method: APHA 4500-NO2 Nitrite Nitrogen by FIA	Melbourne	Feb 01, 2016	2 Day
Organic Nitrogen (as N) - Method: APHA 4500 Organic Nitrogen (N)	Melbourne	Feb 01, 2016	7 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Feb 01, 2016	7 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Jan 29, 2016	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Jan 29, 2016	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Jan 29, 2016	28 Day
E.coli - Method: LTM-MIC-6621	Melbourne	Jan 29, 2016	24 Hour
Thermotolerant Coliforms - Method: Inhouse LTM-MIC-6623: Thermotolerant Coliforms by MPN	Melbourne	Jan 29, 2016	24 Hour
Eurofins mgt Suite B11			
Chloride - Method: MGT 1100A	Melbourne	Jan 29, 2016	28 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Jan 29, 2016	28 Day
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Feb 01, 2016	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Feb 01, 2016	7 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Jan 29, 2016	180 Day

Internal Quality Control Review and Glossary

General

- Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
- All soil results are reported on a dry basis, unless otherwise stated.
- Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- Results are uncorrected for matrix spikes or surrogate recoveries.
- SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

- Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
- Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
- Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments
Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
Q19	TDS may bias high due to the presence of fine particulate or colloidal matter that may pass through the filter paper.

Final report - this Report replaces any previously issued Report

- Indicates Not Requested

* Indicates NATA accreditation does not cover the performance of this service

Uncertainty data is available on request

Eurofins | mgt shall not be liable for loss, cost, damages or expenses incurred by the client, or any other person or company, resulting from the use of any information or interpretation given in this report. In no case shall Eurofins | mgt be liable for consequential damages including, but not limited to, lost profits, damages for failure to meet deadlines and lost production arising from this report. This document shall not be reproduced except in full and relates only to the items tested. Unless indicated otherwise, the tests were performed on the samples as received.

Sample Receipt Advice

Company name: **Coffey Environments Pty Ltd WA**
Contact name: **Richelle Bunbury**
Project name: **NL_BASELINE GW_SW MONITORING**
Project ID: **ENAUPTERT04483AA MONITORING EVENT 2**
COC number: **Not provided**
Turn around time: **5 Day**
Date/Time received: **Feb 4, 2016 8:59 AM**
Eurofins | mgt reference: **487822**

Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- Sample containers for volatile analysis received with zero headspace.
- Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Natalie Krasselt on Phone : (+61) (3) 8564 5000 or by e.mail: NatalieKrasselt@eurofins.com

Results will be delivered electronically via e.mail to Richelle Bunbury - richelle_bunbury@coffey.com.

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
∅ = ALS is not NATA accredited for these tests.

- Ultratrace metals conducted by ALS Sydney, NATA accreditation no. 825, site no 10911.
- TDS by method EA-015 may bias high due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA Accredited
Laboratory 825

Accredited for
compliance with
ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Jeremy Truong	Laboratory Supervisor	Perth Inorganics, Malaga, WA
Scott James	Laboratory Manager	Perth Inorganics, Malaga, WA
Shobhna Chandra	Metals Coordinator	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Analysis Holding Time Compliance

Matrix: **WATER**

Method Container / Client Sample ID(s)	Extraction / Preparation			Analysis		
	Date extracted	Due for extraction	Days overdue	Date analysed	Due for analysis	Days overdue
EA005P: pH by PC Titrator						
Miscellaneous Plastic bottle -unpreserved QC27	----	----	----	02-Feb-2016	01-Feb-2016	1

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: * = Holding time breach ; ✓ = Within holding time.

Method Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by PC Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Conductivity by PC Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of 'filterable' residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM (2013) Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3)
Acidity as Calcium Carbonate	ED038	WATER	In house: Referenced to APHA 2310 B Acidity is determined by titration with a standardised alkali to an end-point pH of 8.3. This method is compliant with NEPM (2013) Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM (2013) Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM (2013) Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Dissolved Metals in Fresh Water -Suite A by ORC-ICPMS	EG094A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020 Samples are 0.45µm filtered prior to analysis. The ORC-ICPMS technique removes interfering species through a series of chemical reactions prior to ion detection. Ions are passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to measurement by a discrete dynode ion detector. This method is compliant with NEPM (2013) Schedule B(3)
Total Metals in Fresh Water -Suite A by ORC-ICPMS	EG094A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020. The ORC-ICPMS technique removes interfering species through a series of chemical reactions prior to ion detection. Ions are passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to measurement by a discrete dynode ion detector. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH ₃ G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO ₂ - B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined separately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite and Nitrate as N (NO _x) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Combined oxidised Nitrogen (NO ₂ +NO ₃) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO ₃ -. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)

<i>Analytical Methods</i>			
<i>Method</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with orthophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM (2013) Schedule B(3)
<i>Preparation Methods</i>			
<i>Method</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)

Zinc (filtered)	0.001	mg/L	0.004

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Feb 11, 2016	14 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Jan 29, 2016	28 Day
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Feb 01, 2016	2 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Jan 29, 2016	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Jan 29, 2016	28 Day
Phosphorus reactive (as P) - Method: APHA4500-PO ₄	Melbourne	Jan 29, 2016	2 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Jan 29, 2016	7 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Feb 03, 2016	14 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Jan 29, 2016	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Jan 29, 2016	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Jan 29, 2016	28 Day
Eurofins mgt Suite B11			
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Feb 01, 2016	28 Day
Chloride - Method: MGT 1100A	Melbourne	Jan 29, 2016	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Feb 01, 2016	7 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Jan 29, 2016	28 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Jan 29, 2016	180 Day
Total Nitrogen Set (as N)			
Nitrate & Nitrite (as N) - Method: APHA 4500-NO ₃ /NO ₂ Nitrate-Nitrite Nitrogen by FIA	Melbourne	Feb 01, 2016	28 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Feb 01, 2016	7 Day

Internal Quality Control Review and Glossary

General

- Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
- All soil results are reported on a dry basis, unless otherwise stated.
- Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- Results are uncorrected for matrix spikes or surrogate recoveries.
- SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- Samples were analysed on an 'as received' basis.
- This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

- Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
- Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
- Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments
Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
Q19	TDS may bias high due to the presence of fine particulate or colloidal matter that may pass through the filter paper.
R09	Theoretically the TKN result should be greater or equal to ammonia concentration. However the difference reported is within the uncertainty of the individual tests

Authorised By

Natalie Krasselt	Analytical Services Manager
Emily Rosenberg	Senior Analyst-Metal (VIC)
Huong Le	Senior Analyst-Inorganic (VIC)
Ivan Taylor	Senior Analyst-Metal (NSW)

Glenn Jackson
National Operations Manager

Final report - this Report replaces any previously issued Report

- Indicates Not Requested

* Indicates NATA accreditation does not cover the performance of this service

Uncertainty data is available on request

Eurofins | mgt shall not be liable for loss, cost, damages or expenses incurred by the client, or any other person or company, resulting from the use of any information or interpretation given in this report. In no case shall Eurofins | mgt be liable for consequential damages including, but not limited to, lost profits, damages for failure to meet deadlines and lost production arising from this report. This document shall not be reproduced except in full and relates only to the items tested. Unless indicated otherwise, the tests were performed on the samples as received.

Certificate of Analysis

Coffey Environments Pty Ltd WA
89-91 Burswood Road
Burswood
WA 6100

NATA Accredited
Accreditation Number 1261
Site Number 1254

Accredited for compliance with ISO/IEC 17025.
 The results of the tests, calibrations and/or
 measurements included in this document are traceable
 to Australian/national standards.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Feb 11, 2016	14 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Feb 02, 2016	28 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Feb 02, 2016	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Feb 02, 2016	28 Day
Phosphorus reactive (as P) - Method: APHA4500-PO4	Melbourne	Feb 02, 2016	2 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Feb 01, 2016	7 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Feb 04, 2016	14 Day
Major Anions			
Bicarbonate Alkalinity (as CaCO ₃) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Feb 02, 2016	14 Day
Carbonate Alkalinity (as CaCO ₃) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Feb 02, 2016	14 Day
Chloride - Method: MGT 1100A	Melbourne	Feb 02, 2016	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Feb 02, 2016	7 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Feb 02, 2016	28 Day
Nitrogens (speciated)			
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Feb 04, 2016	7 Day
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Feb 04, 2016	2 Day
Organic Nitrogen (as N) - Method: APHA 4500 Organic Nitrogen (N)	Melbourne	Feb 04, 2016	7 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Feb 04, 2016	7 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 01, 2016	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 01, 2016	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 01, 2016	28 Day
Major Cations			
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Feb 04, 2016	28 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Feb 01, 2016	180 Day

Internal Quality Control Review and Glossary

General

- Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
- All soil results are reported on a dry basis, unless otherwise stated.
- Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- Results are uncorrected for matrix spikes or surrogate recoveries.
- SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

- Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
- Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
- Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments
Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
Q19	TDS may bias high due to the presence of fine particulate or colloidal matter that may pass through the filter paper.

Final report - this Report replaces any previously issued Report

- Indicates Not Requested

* Indicates NATA accreditation does not cover the performance of this service

Uncertainty data is available on request

Eurofins | mgt shall not be liable for loss, cost, damages or expenses incurred by the client, or any other person or company, resulting from the use of any information or interpretation given in this report. In no case shall Eurofins | mgt be liable for consequential damages including, but not limited to, lost profits, damages for failure to meet deadlines and lost production arising from this report. This document shall not be reproduced except in full and relates only to the items tested. Unless indicated otherwise, the tests were performed on the samples as received.

Certificate of Analysis

Coffey Environments Pty Ltd WA
89-91 Burswood Road
Burswood
WA 6100

NATA Accredited
Accreditation Number 1261
Site Number 1254

Accredited for compliance with ISO/IEC 17025.
The results of the tests, calibrations and/or
measurements included in this document are traceable
to Australian/national standards.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Feb 03, 2016	14 Day
Chloride - Method: MGT 1100A	Melbourne	Feb 03, 2016	28 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Feb 03, 2016	28 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Feb 03, 2016	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Feb 03, 2016	28 Day
Phosphorus reactive (as P) - Method: APHA4500-PO4	Melbourne	Feb 03, 2016	2 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Feb 03, 2016	28 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Feb 02, 2016	7 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Feb 03, 2016	14 Day
Nitrogens (speciated)			
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Feb 04, 2016	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Feb 04, 2016	7 Day
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Feb 04, 2016	2 Day
Organic Nitrogen (as N) - Method: APHA 4500 Organic Nitrogen (N)	Melbourne	Feb 04, 2016	7 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Feb 04, 2016	7 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 02, 2016	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 02, 2016	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 02, 2016	28 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Feb 02, 2016	180 Day

Internal Quality Control Review and Glossary

General

- Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
- All soil results are reported on a dry basis, unless otherwise stated.
- Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- Results are uncorrected for matrix spikes or surrogate recoveries.
- SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- Samples were analysed on an 'as received' basis.
- This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

- Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
- Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
- Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Final report - this Report replaces any previously issued Report

- Indicates Not Requested

* Indicates NATA accreditation does not cover the performance of this service

Uncertainty data is available on request

Eurofins | mgt shall not be liable for loss, cost, damages or expenses incurred by the client, or any other person or company, resulting from the use of any information or interpretation given in this report. In no case shall Eurofins | mgt be liable for consequential damages including, but not limited to, lost profits, damages for failure to meet deadlines and lost production arising from this report. This document shall not be reproduced except in full and relates only to the items tested. Unless indicated otherwise, the tests were performed on the samples as received.

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
∅ = ALS is not NATA accredited for these tests.

- EG020: It is recognised that total manganese is less than dissolved manganese for sample 'QC37'. However, the difference is within experimental variation of the methods.
- TDS by method EA-015 may bias high due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- MW006: estimate (~) is reported where there are many non-target colonies; the typical colonies may be masked by overgrowth of non-target organisms. It may be informative to record this fact.
- MW006 is ALS's internal code and is equivalent to AS4276.7.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA Accredited
Laboratory 825

Accredited for
compliance with
ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Alini Goundar	Senior Analyst	Perth Microbiology, Malaga, WA
Canhuang Ke	Metals Instrument Chemist	Perth Inorganics, Malaga, WA
Jeremy Truong	Laboratory Supervisor	Perth Inorganics, Malaga, WA

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- **NO** Quality Control Sample Frequency Outliers exist.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: WATER

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
ED041G: Sulfate (Turbidimetric) as SO4 2- by DA	EP1600833--008	Anonymous	Sulfate as SO4 - Turbidimetric	14808-79-8	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EK059G: Nitrite plus Nitrate as N (NOx) by Discrete Ar	EP1600811--001	Anonymous	Nitrite + Nitrate as N	----	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: WATER

Evaluation: ✘ = Holding time breach ; ✔ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: * = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)							
Acidity as Calcium Carbonate	ED038	2	15	13.33	10.00	✓	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by PC Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Conductivity by PC Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of 'filterable' residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM (2013) Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3)
Acidity as Calcium Carbonate	ED038	WATER	In house: Referenced to APHA 2310 B Acidity is determined by titration with a standardised alkali to an end-point pH of 8.3. This method is compliant with NEPM (2013) Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM (2013) Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM (2013) Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH ₃ G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO ₂ - B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite and Nitrate as N (NO _x) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Combined oxidised Nitrogen (NO ₂ +NO ₃) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO ₃ -. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with orthophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Ionic Balance by PCT DA and Turbi SO ₄ DA	EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM (2013) Schedule B(3)
Thermotolerant Coliforms & E.coli by Membrane Filtration	MW006	WATER	In house: Referenced to AS 4276.7 2007

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)

Certificate of Analysis

Coffey Environments Pty Ltd WA
89-91 Burswood Road
Burswood
WA 6100

NATA Accredited
Accreditation Number 1261
Site Number 1254 & 14271

Accredited for compliance with ISO/IEC 17025.
The results of the tests, calibrations and/or
measurements included in this document are traceable
to Australian/national standards.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Feb 03, 2016	14 Day
Chloride - Method: MGT 1100A	Melbourne	Feb 04, 2016	28 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Feb 03, 2016	28 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Feb 03, 2016	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Feb 03, 2016	28 Day
Phosphorus reactive (as P) - Method: APHA4500-PO4	Melbourne	Feb 04, 2016	2 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Feb 04, 2016	28 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Feb 03, 2016	7 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Feb 05, 2016	14 Day
Nitrogens (speciated)			
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Feb 05, 2016	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Feb 05, 2016	7 Day
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Feb 05, 2016	2 Day
Organic Nitrogen (as N) - Method: APHA 4500 Organic Nitrogen (N)	Melbourne	Feb 05, 2016	7 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Feb 05, 2016	7 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 03, 2016	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 03, 2016	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 03, 2016	28 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Feb 03, 2016	180 Day
E.coli - Method: LTM-MIC-6621	Melbourne	Feb 03, 2016	24 Hour
Thermotolerant Coliforms - Method: Inhouse LTM-MIC-6623: Thermotolerant Coliforms by MPN	Melbourne	Feb 03, 2016	24 Hour

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Method Blank

Comments
Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	No
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
G01	The LORs have been raised due to matrix interference
Q19	TDS may bias high due to the presence of fine particulate or colloidal matter that may pass through the filter paper.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Eurofins mgt Suite B1			
Total Recoverable Hydrocarbons - 1999 NEPM Fractions - Method: TRH C6-C36 - LTM-ORG-2010	Melbourne	Feb 10, 2016	7 Day
BTEX - Method: TRH C6-C40 - LTM-ORG-2010	Melbourne	Feb 04, 2016	14 Day
Total Recoverable Hydrocarbons - 2013 NEPM Fractions - Method: TRH C6-C40 - LTM-ORG-2010	Melbourne	Feb 04, 2016	7 Day

Organophosphorous Pesticides - Method: USEPA 8270 Organophosphorus Pesticides	Melbourne	Feb 10, 2016	7 Day
Semivolatile Organics - Method: USEPA 8270 Semivolatile Organics	Melbourne	Feb 10, 2016	7 Day
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Feb 16, 2016	14 Day
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Feb 08, 2016	28 Day
Chloride - Method: MGT 1100A	Melbourne	Feb 04, 2016	28 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Feb 05, 2016	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Feb 08, 2016	7 Day
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Feb 08, 2016	2 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Feb 05, 2016	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Feb 04, 2016	28 Day
Phosphorus reactive (as P) - Method: APHA4500-PO ₄	Melbourne	Feb 04, 2016	2 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Feb 04, 2016	28 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Feb 04, 2016	7 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Feb 09, 2016	14 Day
Nitrogens (speciated)			
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Feb 08, 2016	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Feb 08, 2016	7 Day
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Feb 08, 2016	2 Day
Organic Nitrogen (as N) - Method: APHA 4500 Organic Nitrogen (N)	Melbourne	Feb 08, 2016	7 Day
Heavy Metals			
- Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 05, 2016	180 Day
Heavy Metals (filtered)			
- Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 05, 2016	180 Day

Description	Testing Site	Extracted	Holding Time
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 05, 2016	28 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Feb 04, 2016	180 Day
E.coli - Method: LTM-MIC-6621	Melbourne	Feb 05, 2016	24 Hour
Thermotolerant Coliforms - Method: Inhouse LTM-MIC-6623: Thermotolerant Coliforms by MPN	Melbourne	Feb 05, 2016	24 Hour
Total Nitrogen Set (as N)			
Nitrate & Nitrite (as N) - Method: APHA 4500-NO3/NO2 Nitrate-Nitrite Nitrogen by FIA	Melbourne	Feb 08, 2016	28 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Feb 08, 2016	7 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Feb 08, 2016	7 Day

Internal Quality Control Review and Glossary

General

- Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
- All soil results are reported on a dry basis, unless otherwise stated.
- Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- Results are uncorrected for matrix spikes or surrogate recoveries.
- SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC Data General Comments

- Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
- Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
- Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments
Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
M01	Microbiological Testing performed outside the recommended holding time
M15	LOR raised due to physical properties of sample
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q19	TDS may bias high due to the presence of fine particulate or colloidal matter that may pass through the filter paper.

Eurofins | mgt shall not be liable for loss, cost, damages or expenses incurred by the client, or any other person or company, resulting from the use of any information or interpretation given in this report. In no case shall Eurofins | mgt be liable for consequential damages including, but not limited to, lost profits, damages for failure to meet deadlines and lost production arising from this report. This document shall not be reproduced except in full and relates only to the items tested. Unless indicated otherwise, the tests were performed on the samples as received.

Sample Receipt Advice

Company name: **Coffey Environments Pty Ltd WA**
Contact name: **Richelle Bunbury**
Project name: **NL_BASELINE GW_SW MONITORING**
Project ID: **ENAUPERT04483AA**
COC number: **Not provided**
Turn around time: **5 Day**
Date/Time received: **Feb 17, 2016 8:34 AM**
Eurofins | mgt reference: **489413**

Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- N/A Sample containers for volatile analysis received with zero headspace.
- Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Natalie Krasselt on Phone : (+61) (3) 8564 5000 or by e.mail: NatalieKrasselt@eurofins.com

Results will be delivered electronically via e.mail to Richelle Bunbury - richelle_bunbury@coffey.com.

Certificate of Analysis

Coffey Environments Pty Ltd WA
89-91 Burswood Road
Burswood
WA 6100

NATA Accredited
Accreditation Number 1261
Site Number 1254 & 14271

Accredited for compliance with ISO/IEC 17025.
The results of the tests, calibrations and/or
measurements included in this document are traceable
to Australian/national standards.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO ₃) - Method: APHA 2310 Acidity	Melbourne	Feb 19, 2016	14 Day
Conductivity (at 25°C) - Method: LTM-INO-4030	Melbourne	Feb 17, 2016	28 Day
pH - Method: LTM-GEN-7090 pH in water by ISE	Melbourne	Feb 17, 2016	0 Hours
Phosphate total (as P) - Method: APHA 4500-P E. Phosphorous	Melbourne	Feb 17, 2016	28 Day
Phosphorus reactive (as P) - Method: APHA4500-PO ₄	Melbourne	Feb 18, 2016	2 Day
Total Dissolved Solids - Method: APHA 2540C Total Dissolved Solids	Melbourne	Feb 17, 2016	7 Day
Turbidity - Method: LTM-INO-4140 'Turbidity by Nephelometric Method'	Melbourne	Feb 18, 2016	2 Day
Nitrogens (speciated)			
Nitrite (as N) - Method: APHA 4500-NO ₂ Nitrite Nitrogen by FIA	Melbourne	Feb 19, 2016	2 Day
Organic Nitrogen (as N) - Method: APHA 4500 Organic Nitrogen (N)	Melbourne	Feb 19, 2016	7 Day
Total Kjeldahl Nitrogen (as N) - Method: APHA 4500 TKN	Melbourne	Feb 19, 2016	7 Day
Heavy Metals - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 22, 2016	180 Day
Heavy Metals (filtered) - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 22, 2016	180 Day
Mobil Metals : Metals M15 - Method: LTM-MET-3040 Metals in Waters by ICP-MS	Melbourne	Feb 22, 2016	28 Day
E.coli - Method: LTM-MIC-6621	Melbourne	Feb 17, 2016	24 Hour
Thermotolerant Coliforms - Method: Inhouse LTM-MIC-6623: Thermotolerant Coliforms by MPN	Melbourne	Feb 17, 2016	24 Hour
Eurofins mgt Suite B11			
Chloride - Method: MGT 1100A	Melbourne	Feb 18, 2016	28 Day
Sulphate (as S) - Method: In house MGT1110A (SO ₄ by Discrete Analyser)	Melbourne	Feb 18, 2016	28 Day
Alkalinity (speciated) - Method: APHA 2320 Alkalinity by Titration	Melbourne	Feb 17, 2016	14 Day
Ammonia (as N) - Method: APHA 4500-NH ₃ Ammonia Nitrogen by FIA	Melbourne	Feb 19, 2016	28 Day
Nitrate (as N) - Method: APHA 4500-NO ₃ Nitrate Nitrogen by FIA	Melbourne	Feb 19, 2016	7 Day
Alkali Metals - Method: USEPA 6010 Alkali Metals	Melbourne	Feb 17, 2016	180 Day

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).
