

BLACK COCKATOO BREEDING, FEEDING AND ROOSTING HABITAT ASSESSMENT, TONKIN HIGHWAY EXTENSION.

TONY KIRKBY.

The purpose of the survey was to assess breeding, foraging, drinking and roosting habitat for three species of black cockatoos *Calyptorhynchus spp.* at The Tonkin Highway extension and identify if the survey area occurs within currently known foraging, and breeding areas

SPECIES BACKGROUND INFORMATION.

Three species of black cockatoo occur in the south west of Western Australia, Carnaby's Cockatoo *Calyptorhynchus latirostris*, Baudin's Cockatoo *C. baudinii* and the Forest Red-tailed Black Cockatoo (FRTBC) *C. 1argina naso*. Carnaby's and Baudin's Cockatoos are known collectively as 'white-tailed black cockatoos'.

Both Baudin's and Carnaby's Cockatoos are listed (Endangered) under the Western Australian Wildlife Conservation Act, and the Environmental Protection and Biodiversity Conservation Act (EPBC Act).

The FRTBC is listed as Vulnerable under the Western Australian Wildlife Conservation Act and the EPBC Act.

All three species are known from the general area of the survey.

The nearest confirmed breeding site of FRTBC is 8 km to the east in the Wungong Catchment though pairs have also been observed prospecting and chewing hollow entrances at Cardup Nature Reserve which lies 1.5 km to the east. There is also confirmed breeding of FRTBC in an artificial hollow at Serpentine

The nearest known Carnaby's Cockatoo breeding site is 10 km to the east in the Wungong Catchment.

Baudin's Cockatoo are known to breed in low numbers 16 km east in Wungong Catchment and 10 km south in Serpentine Hills area.

BREEDING HABITAT AT THE SURVEY AREA.

Trees which could provide breeding hollows at the survey area are Jarrah *Eucalyptus marginata*, Wandoo *E. wandoo*, Flooded Gum *E. rudis* and Marri *Corymbia calophylla*. These trees need to have reached a diameter at breast height (DBH) of at least 500mm (300mm for Wandoo) in order to be large enough to form a breeding hollow.

FORAGING HABITAT AT THE SURVEY AREA.

Species providing foraging habitat at the survey include Jarrah, Marri, Sheoak *Allocasuarina fraseriana*, Swamp Sheoak *Casuarina obesa*, *Banksia menziesii*, *B. ilicifolia hakea spp*, Balga *Xanthorrhoea priessii* and Cape Lilac *Melia azedarach*.

ROOSTING HABITAT AT THE SURVEY AREA.

Jarrah, Marri, Wandoo and exotic eucalypts at the survey area are all able to provide a roost for black cockatoos.

Important food species at the survey area and their general relevance to black cockatoos.

Jarrah – seeds taken by FRTBC and Carnaby's Cockatoos. There are also records of Baudin's Cockatoos feeding from Jarrah seeds but it is very unusual, also nectar and grubs are taken by Baudin's and Carnaby's Cockatoos.

Marri – seeds taken by all three species of black cockatoos, also nectar and grubs are taken by Baudin's and Carnaby's Cockatoos. This is the most important and well represented food species at the survey area.

Sheoak – seeds are taken by FRTBC but it is poorly represented in the survey area.

Banksia menziesii - seeds, nectar and grubs taken by Baudins' and Carnaby's Cockatoos. *B.menziesii* is an important food species but is poorly represented in the survey area.

Banksia ilicifolia – seeds, nectar and grubs taken by Carnaby's and probably Baudin's Cockatoos. This is an important food species but is poorly represented with only a few trees in the southern of the survey area.

Balga *Xanthorrhoea priessii*. Grubs and nectar are taken by both Carnaby's and Baudin's Cockatoos.

Cape Lilac – seeds taken by FRTBC. Note this is an introduced species which is considered a weed but has become a seasonally important food for FRTBC on parts of the Swan Coastal Plain.

The survey area also contains exotic eucalypt species which may provide nectar to both Baudin's and Carnaby's Cockatoos.

Drinking sites.

Although no drinking sites are documented for the survey or surrounding areas it is expected water would be available throughout the year from gardens, farm dams, stock troughs and natural water bodies which are found throughout the Byford/Mundijong areas.

METHODS.

The area was surveyed between 16th April and 5th May 2019 20th. All trees at the survey area above 500mm DBH (300mm for Wandoo) were picked up using hand held GPS. Trees were also checked from ground level for the presence of suitable black cockatoo breeding hollows.

Feeding residues were recorded and picked up using hand held GPS.

Areas beneath possible roosting trees were searched for the presence of clipped leaves and branches which may indicate a roost. Evening searches for roosting sites were also undertaken.

A search of the Western Australian Museum database was undertaken to locate the nearest known black cockatoo breeding and roosting sites.

The 'Great Cocky Count' database (Birdlife Western Australia) was also used to locate the nearest known black cockatoo roosting sites.

RESULTS. Appendix A for individual results

Breeding habitat.

A total of 490 trees above the required DBH were located. 89 Flooded Gum, 20 Jarrah, two Wandoo and 379 Marri (Appendix B). A total of 22 hollows were located and of these 13 were potentially black cockatoo nesting hollows. Four of these hollows also had scarring in or near the hollow entrance which is typical of use by Galah's (Appendix C). The remaining nine hollows were either being used by Galah's at the time of the survey or were of a smaller size suitable for small parrots (Australian Ringneck). Introduced Rainbow Lorikeet were also observed at one hollow.

Foraging.

A total of 111 feeding residues from FRTBC and Baudin's Cockatoo were located.

FRTBC - feeding residues (85) from Marri were plentiful, easy to locate and ranged from brown to old and grey and possibly up to two years old.

Baudin's Cockatoo – feeding residues from Marri were noted at 24 locations. All residues were either brown or grey.

Roosting.

No roosting sites were located during the survey.

The nearest known roost sites of FRTBC are at Cardup Siding Rd, Cardup and Kiernan St, Mundijong located 1.8 km and 2.8 km respectively to the east of the survey area.

Sightings.

A single female FRTBC was seen during the survey.

Baudin's Cockatoos were noted feeding on seeds from Marri (just outside the survey area) and a pair were seen overhead.

Discussion.

A total of 490 trees at the survey reach the criteria to be classed as potential breeding trees - 500mm DBH or in the case of Wandoo 300mm. The most important of these are Jarrah and Marri (399 trees), particularly Marri. In the Jarrah/Marri forest Marri provides over 90% of black cockatoo breeding hollows (*Johnstone, Kirkby and Sarti 2011*). Flooded Gums (89 trees) were also present but they appear to provide very few breeding hollows. The author has first hand knowledge of over 500 black cockatoo breeding trees and only a single breeding hollow is known from Flooded Gum.

Marri feeding residues left behind by FRTBC and Baudin's Cockatoo were located throughout the survey area in suitable habitat. The remnant vegetation throughout the survey area is probably important foraging habitat for the local populations of these species. No feeding residues from Carnaby's Cockatoos were located but given the limited amount of their preferred banksia foraging habitat this was to be expected.

The lack of actual sightings of black cockatoos during the survey is not unexpected as FRTBC utilise these patches of remnant vegetation only when Marri has a productive seeding year (*Black Cockatoo Research Progress Report to dept of Housing 2015, WA Museum*). Baudin's Cockatoos tend to use this area of the Swan Coastal Plain between August and October before the bulk of the population return south to breed (*Johnstone and Kirkby 2008*).

Though it is possible the survey area could provide a roosting site for black cockatoos none were roosting there during the survey.

Appendix A – Raw Cockatoo Data
