# Threatened and Priority <br> Flora Report Form 

Please complete as much of the form as possible, with emphasis on those sections bordered in black. For information on how to complete the form please refer to the Threatened \& Priority Flora Report Form (TPRF) manual on the DBCA website at http://dpaw.wa.gov.aul under Standard Report Forms

| TAXON: Hibbertia spicata subsp. lepotheca |  | TPFL Pop. No: |  |
| :---: | :---: | :---: | :---: |
| OBSERVATION DATE: 18/09/18-18/12/18 | CONSERVATION STATUS: | P3 | New population $\boxtimes$ |
| OBSERVER/S: Angela Benkovic and Erin Lynch |  | PHONE: | 62228361 |
| ROLE: Botanist | ORGANISATION: GHD |  |  |

| AREA ASSESSMENT: Edge survey $\square$ |  | rrial survey $\square$ | urvey $\boxtimes$ Area | observed ( $\mathrm{m}^{2}$ ): | 1046 ha |
| :---: | :---: | :---: | :---: | :---: | :---: |
| EFFORT: Time spent surveying (minutes): 28 days $\quad$ No. of minutes spent/ $100 \mathrm{~m}^{2}$ : |  |  |  |  |  |
| POP'N COUNT ACCURACY: | Actual $\boxtimes$ | Extrapolation $\square$ | Estimate $\square$ <br> (Refer to | Count method: <br> field manual for list) |  |
| WHAT COUNTED: | Plants $\boxtimes$ | Clumps $\square$ | Clonal stems $\square$ |  |  |
| TOTAL POP'N STRUCTURE: | Mature: | Juveniles: | Seedlings: | Totals: |  |
| Alive | 214 |  |  |  | Area of pop ( $\mathrm{m}^{2}$ ): |
| Dead |  |  |  |  | Note: Pls record count as numbers (not percentages) for database. |
| QUADRATS PRESENT: | No. | Size | Data attached $\square$ |  | f quadrats ( $\mathrm{m}^{2}$ ): |
| Summary Quad. Totals: Alive |  |  |  |  |  |
| REPRODUCTIVE STATE: | Clonal $\square$ | Vegetative $\square$ | Flowerbud $\boxtimes$ |  | - ${ }^{\text {a }}$ - |
| Immature fruit $\square$ |  | Fruit $\square$ | Dehisced fruit $\square$ | Percentag | ge in flower: ___ \% |
| CONDITION OF PLANTS: | Healthy $\boxtimes$ | Moderate $\square$ | Poor $\square$ | Senes | cent $\square$ |

COMMENT:

| THREATS - type, agent and supporting information: <br> Eg clearing, too frequent fire, weed, disease. Refer to field manual for list of threats \& agents. Specify agent where relevant. <br> Rate current and potential threat impact: $\mathrm{N}=\mathrm{Nil}, \mathrm{L}=\mathrm{Low}, \mathrm{M}=$ Medium, $\mathrm{H}=\mathrm{High}, \mathrm{E}=$ Extreme <br> Estimate time to potential impact: S=Short (<12mths), M=Medium (<5yrs), L=Long (5yrs+) | Current impact <br> (N-E) | Potential Impact (L-E) | Potential Threat Onset (S-L) |
| :---: | :---: | :---: | :---: |
| - Clearing by MRWA for the Mitchell fwy extension from Hester Ave to Romeo Rd within Road reserve | L | L | M |
| - |  |  |  |
| - |  |  |  |

Please return completed form to Species And Communities Branch DBCA, Locked Bag 104, BENTLEY DELIVERY CENTRE WA 6983 OR email to: flora.data@dbca.wa.gov.au

# Threatened and Priority Flora Report Form 

OTHER COMMENTS: (Please include recommended management actions and/or implemented actions - include date. Also include details of additional data available, and how to locate it.)

DRF PERMIT/ LICENCE No: SL012366 Note if only observing plants (i.e. no specimens or plant matieral is taken) then no permitlicence is required. For further information on permit and licening requirements see the Threatened Flora and Wildlife Licensing pages on DBCA's website. Any actions carried out under licence/permit should be recorded above in the OTHER COMMENTS section.

| SPECIMEN: Collectors No: |  | WA Herb. $\boxtimes \quad$ Regional Herb. $\square \quad$ District Herb. $\square$ |  |
| :---: | :---: | :---: | :---: |
| ATTACHED: | Map $\square$ Mudmap $\square$ | Photo $\square \quad$ GIS data $\square$ | Field notes $\square$ |
| COPY SENT TO: | : Regional Office $\square$ | District Office $\square$ | Other: |

Submitter of Record: _Angela Benkovic__ Role:__Botanist__ Signed: Lenke_ Date: 05/03/2019

Please return completed form to Species And Communities Branch DBCA, Locked Bag 104, BENTLEY DELIVERY CENTRE WA 6983 OR email to: flora.data@dbca.wa.gov.au

RECORDS: Please forward to Flora Administrative Officer, Species and Communities Branch.

## Appendix E - Fauna data

Fauna species list
Trapping results
Camera trap results
Black Cockatoo habitat assessment data
Black Cockatoo Tree monitoring data
Fauna likelihood of occurrence

Fauna list for previous and this survey

Trees with suitable hollows selected for monitoring in the survey area

| Number | Tree Species | DBH | Hollows Present | Hollow Entrance Size (CM) | Hollow Heights (M) | $\begin{aligned} & \text { Breeding } \\ & \text { Evidence } \end{aligned}$ | Hollow Pole Cam Inspection | Hollow Depth | Hollow Angle | Comment August | Comment November | Comment January |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| T73 | Tuart | 1410 | 3 large | all 20 plus | 7, 9, 12 | no evidence of use | yes | $\begin{aligned} & 7 \mathrm{~m}>1 \mathrm{~m}, 9 \mathrm{~m} \\ & 40 \mathrm{~cm}, 12 \mathrm{~m} 30 \mathrm{~cm} \end{aligned}$ | $\begin{aligned} & \text { 2x } \\ & \text { vertical, } 1 x \\ & 45 \end{aligned}$ | 7 m is blocked, $9 \mathrm{~m}>1 \mathrm{~m}$ deep into trunk but had barn owl, 12 m blocked at 40 cm , other unknown but bees present. <br> No Black Cocky use | Barn owl hollow too high to reach with pole cam but no external evidence of use. Lower large hollow checked but blocked with wood. No Black Cocky use | $3 \times$ hollows checked. 7 m hollow blocked with rotten wood, 9 m hollow is trunk hollow, 12 m hollow is trunk hollow with bees present. No evidence of black cocky use. |
| T78 | Tuart | 920 | 3 large | 16, 20, 24 | 7, 12, 15 | potential old chews | yes, lower hollow | 7 m is 30 cm deep | slight angle | old chews in lower hollow, galah in top one. No Black Cocky use | Top hollow that had Galahs has chews but no signs of current activity. Bees in second hollow. No camera pic. No Black Cocky use | No hollow visible at 7 m (branch down). 12 m is spout hollow on south side of tree, old chew marks and possible owl scats (urates) visible. 15 m hollow contains bees. No Black Cocky use |
| T87 | Tuart | 2500 | 2 large | $2 \times 16$ | 12 to 15 | no evidence of use | yes | $\begin{aligned} & 12 \mathrm{~m} 10 \mathrm{~cm}, 15 \mathrm{~m} \\ & \text { to high } \end{aligned}$ | almost vertical | 15 m to high but Eastern Long-billed Corella in 15 m . No Black Cocky use | Visual only as hollow was too high for pole cam. Hollow hard to inspect but no external evidence of use. No Black Cocky use | 2 x hollows visually inspected. 12 m and 15 m hollows both in diagonal branch. Also a recently fallen branch containing hollow. No Black Cocky use |
| T103 | Tuart | 1300 | 1 large | 16 | 6 | no evidence of use | yes | 1 m | almost vertical | Potentially a bit low monitor. No Black Cocky use | Visual inspection as too high for pole cam. No signs of use. No Black Cocky use | $1 \times$ hollow checked, vertical sawn off spout at 4 m . No evidence of use. No Black Cocky use |
| T106 | Tuart | 1600 | 4 large | all 20 plus | $\begin{aligned} & 4,6,8, \\ & 12 \end{aligned}$ | no evidence of use | yes | 4 m approx 1 m , $6 \mathrm{~m} 20 \mathrm{~cm}, 8 \mathrm{~m}$ 1.2 m | 2 x vertical, horizontal | 8 m 1.2 deep galah nesting great hollow. Old chews but no Black Cocky use | Visual inspection as hollow too high for pole cam. No visual external evidence of use. Galahs were gone. No use observed. No Black Cocky use | $4 \times$ hollows checked. 4 m hollow had termite activity, 6 m hollow had dead wood blocking most of hollow, 8 m hollow had a barn owl roosting who flew out, 12 m was too high for pole cam but was visually inspected with no evidence of use. No Black Cocky use |
| T236 | Tuart | 2200 | 1 large, 1 small | 20, 5 | 20, 3 | no evidence of use | yes | 3 m 30 cm (bees) | vertical | Multistem with listed hollow contains beehive No Black Cocky use | Galahs in large hollow. No Black Cocky use | 3 m high hollow contains bees and is located on east side of tree. 20 m hollow is located on west side of tree on a spout. No evidence of use. |
| T239 | Tuart | 2200 | $\begin{aligned} & 2 \text { large, } \\ & 2 \\ & \text { medium } \end{aligned}$ | $\begin{aligned} & 10,15,15, \\ & 10 \end{aligned}$ | $\begin{aligned} & 6,8,8.5, \\ & 20 \end{aligned}$ | old chews present | yes | $\begin{aligned} & 6 \mathrm{~m} 10 \mathrm{~cm}, 8 \mathrm{~m} 10 \\ & \mathrm{~cm}, 8.5 \mathrm{~m} 10 \mathrm{~cm} \end{aligned}$ | 45 and vertical | Multistem, 28 parrots appear nesting in upper canopy. Numerous hollows but no Black Cocky use | No Black Cocky use | 2 large at 8 m . Low empty and shallow, 8 m is solid stump with no hollow, 8.5 m is 20 cm deep. 20 m had visual inspection, no bees and no evidence of use. Whistling kite hanging around. The 20 m hollow is north facing on a broken branch. No Black Cocky use |
| T242 | Tuart | 1800 | $\begin{aligned} & 2 \text { large, } \\ & 1 \\ & \text { medium } \end{aligned}$ | 20, 10, 20 | 8, 15, 20 | Possible internal chews | yes | 8 mg cm | vertical | 20 m hollow guarded by galahs in tree. No Black Cocky use | Bees present in 2 hollows ( $1 \times$ large, $1 \times$ med), other large hollow had chews, feathers and nesting material. | Medium hollow located on northwest side, at least 50 cm deep. No evidence of use. 15 m hollow is a branch hollow on the north side of tree. No evidence of use. 15 m hollow is in black fork hollow (burned) in centre of tree. No evidence of use. 20 m hollow is south facing vertical branch hollow near top of tree. Old chew marks present, otherwise no evidence of use. |
| T245 | Tuart | 2000 | 3 large | 20, 15, 20 | $\begin{aligned} & 25,30, \\ & 10 \end{aligned}$ | no evidence of use | no to high | not assessed | 45 | Galahs in tree and chewing on branches, bees present in lower hollow but upper large ones look good | Some chews on highest hollow, no other evidence of use suspect Galah. Could not reach with pole cam. | 10 m hollow is southwest facing at about 20 cm deep. No evidence of use. 25 m hollow has 20 cm diameter and is a trunk hollow near a fork. Bees present. 30 m hollow is trunk hollow facing east in centre of tree. No evidence of use. |
| T252 | Tuart | 1600 | 2 large | 15, 15 | 15, 25 | old chews present | no to high | not assessed | 45 | bees in lower hollow, but large above has chews possible Galah but monitor | Large hollow has historic chews - Galah. Small hollow contains bees. Bees also present in split at Galah hollow which is probably not in use. | 15 m hollow is spout hollow with bees present, possible chew marks, NE facing. 25 m hollow at 45 degree angle east facing on branch. No evidence of use, possible old chew marks. |
| T259 | Tuart | 1300 | $\begin{aligned} & 2 \text { large, } \\ & 1 \\ & \text { medium } \end{aligned}$ | 20, 20, 10 | $\begin{aligned} & 10,16, \\ & 17 \end{aligned}$ | no evidence of use | yes | $10 \mathrm{~m} 20 \mathrm{~cm}, 2$ large look good | vertical | Multistem form, All hollows in dead wood from original main stem, potentially more hollows higher | No activity. All hollow appear unused | 10 m hollow on north side of tree is burned and shallow/not hollow. 16 m hollow is east facing. 18 m branch hollow is almost verticle on south side of tree. No evidence of use a any hollow. 18 m branch hollow had bees present on the north section of the tree facing south. Possible hollow at 13 m facing north but to high no use. |
| T299 | Tuart | 1200 | 2 large | 2x 20 | 8, 11 | old chews present | yes | $\begin{aligned} & 8 \mathrm{~m} \\ & \mathrm{~m}\end{aligned} \mathrm{C} \mathrm{m}, 11 \mathrm{~m} 1$ | vertical | Two large hollows present but possible old chews present. | Large hollow has old chews present but no signs of current use. Too high for pole cam to reach. Lower hollow now contains bees - not assessed with pole. Highest hollow may be impacted by beehive below it. | 8 m hollow has bees, 11 m too high for pole cam. Possible old chew marks, no other evidence of use. No sign of bees in upper hollow compared to previous assessment. |
| T308 | Tuart | 750 | $\begin{aligned} & 2 \text { large, } \\ & 1 \text { small } \end{aligned}$ | 5, 30, 20 | 5, 7, 4 | old chews present | yes | $\begin{aligned} & 5 \mathrm{~m} \text { and } 7 \mathrm{~m} \text { same } \\ & \text { hollow. } 1 \mathrm{~m}, 4 \mathrm{~m} \\ & 20 \mathrm{~cm} \end{aligned}$ | vertical and 45 | Dead Tuart with hollows in mainstem, likely all hollows are linked to form one and maybe to deep for use. Possible old chews present. | Several hollows part of the same trunk hollow. Largest hollow blocked with debris at 40 cm , no signs of use, photos taken. Next highest is deep but no signs of activity. | $3 \times$ hollows checked. 4 m hollow was angled and shallow, located on east side of tree, 20 cm deep with frass. 5 m hollow is deep in south side of tree, possible old chew marks. 7 m hollow is deep. No other evidence of use at any hollow. |
| T325 | Tuart | 800 | 1 large | 30 | 7 | old chews present | yes | 1.2 m | vertical | One large hollow of great depth and size possible old chews present externally, no recent use | $1 \times$ large hollow present and deep. No external sign of use, no internal signs of use. Photos taken. | 7 m hollow is deep and near vertical, possible old chew marks externally. No other evidence of use. |
| T327 | Tuart | 950 | 4 large | $\begin{aligned} & 20,20,15, \\ & 25 \end{aligned}$ | $\begin{aligned} & 3,5,6, \\ & 11 \end{aligned}$ | old chews present | yes | $\begin{aligned} & 3 \mathrm{~m} 10 \mathrm{~cm}, 5 \mathrm{~m} 10 \\ & \mathrm{~cm}, 6 \mathrm{~m} 10 \mathrm{~cm}, \\ & 11 \mathrm{~m} 2 \mathrm{~m} \end{aligned}$ | vertical and 45 | Multistem form, Several large hollows with old chews present. Nothing fresh monitor. | Tallest hollow no activity at enterence - no chews. Pics taken of lower hollow - 40 cm deep. No signs of use. | $4 \times$ hollows checked. 3 m hollow 10 cm deep. 7 m (more like 6 m ) big spout hollow. 5 m no hollow, too shallow -10 cm deep and filled with leaf liter. No evidence of black cocky use at any hollow. |

| Botaurus poiciloptilus Australasian Bittern | EN | EN |  | x |  | Densely vegetated freshwater wetlands and, rarely, in estuaries or tidal wetlands. In the southwest of Western Australia, the Bittern is found in beds of tall rush mixed with or near short fine sedge or open pools. It also occurs around swamps, lakes, pools, rivers and channels fringed with lignum Muehlenbeckia, canegrass Eragrostis or other dense vegetation. It occasionally ventures into areas of open water or onto banks (DotE 2018b). | Highly Unlikely There is no suitable habitat for this species within the survey area. | Likely - There is suitable habitat for this species around Nowergup Lake. |
| Calyptorhynchus banksii naso Forest Red-tailed Black Cockatoo | VU | VU |  | X | X | The Forest Red-tailed Black Cockatoo inhabits the dense jarrah, karri, and marri forests receiving more than 600 mm annual average rainfall but also occurs in a range of other forest and woodland types, including Blackbutt (E. patens), Wandoo (E. wandoo), Tuart (E. gomphocephala), Albany Blackbutt (E. staeri), Yate (E. cornuta), and Flooded Gum (E. rudis) (DotE 2012). Habitats tend to have an understorey of balga (Xanthorrhoea spp.), kingia (Kingia australis), snottygobble (Persoonia spp.), parrot bush (Banksia sessillis), holly-leaved mirbelia (Mirbelia dilatata), bull banksia ( $B$. grandis), bullich (Taxandria spp.) and sheoak (Allocasuraina fraseriana). They are most common in the jarrah forest region of the northern Darling Range from Collie north to Mundaring and are very local throughout the lower south-west. They can be found on the Swan Coastal Plain, mainly in search of food the exotic white cedar (Melia azedarach). There are also several small isolated populations in the eastern parts of its range (DotE 2012). | Known - The species was recorded during the survey | Known - The species was recorded during the survey |
| Calyptorhynchus latirostris Carnaby's Black Cockatoo | EN | EN |  | x | x | Carnaby's Black Cockatoo occurs in uncleared or remnant native eucalypt woodlands, especially those that contain salmon gum, wandoo, marri, jarrah and karri, and in shrubland or kwongan heathland dominated by Hakea, Dryandra, Banksia and Grevillea species. Breeding activity is restricted to eucalypt | Known - The species was recorded during the survey | Known - The species was recorded during the survey |

|  |  |  |  |  |  | woodlands mainly in the semiarid and subhumid interior, from Kalbarri in the north, Three Springs District south to the Stirling Range, west to Cockleshell Gully and east to Manmanning. The species has expanded its breeding range westward and south into the jarrah-marri forests of the Darling Scarp and into the tuart forests of the Swan Coastal Plain, including the Yanchep area, Lake Clifton and near Bunbury. It nests in trees older than 120-150 years (DotEE 2018b). |  |  |
| Falco peregrinus Peregrine Falcon |  | OS |  |  | X | The Peregrine Falcon is found on and near cliffs, gorges, timbered watercourses, riverine environments, wetlands, plains, open woodlands, and pylons and spires of buildings, though less frequently in desert regions (Morcombe 2004). They are not common but can be found almost anywhere throughout WA and in the southwest, including particularly at Fitzgerald River, Stirling Range, Porongurup National Parks, Kondinin, and Peak Charles, with many more locations north of Perth (Nevill 2013). | Known - The species was recorded during the survey | Known - The species was recorded during the survey |
| Leipoa ocellata Malleefowl | VU | VU |  | X |  | The Malleefowl generally occurs in semi-arid areas of Western Australia, in shrublands and low woodlands that are dominated by mallee vegetation, as well as native pine Callitris woodlands, Acacia shrublands, paperbark, skheoak, Broombush Melaleuca uncinata vegetation, eucalypt woodlands, or coastal heathlands. Mostly they are found where there are sandy or gravel soils. The nest is a large mound of sand or soil and organic matter (Jones and Goth 2008; Morcombe 2004; Nevill 2013). In WA they are found from the southwest Nullarbor to Albany, north, and then west from Moore River up to Shark Bay, past Cue, across to Wiluna and east to the northern Victoria Desert south of the Blackstone Ranges (Nevill 2013). | Highly Unlikely The survey area is outside the currently known distribution for this species. | Highly Unlikely The survey area is outside the currently known distribution for this species. |

| Limosa lapponica baueri Bar-tailed Godwit | VU | VU |  | X |  | The Bar-tailed godwit (Western Alaskan) occurs mainly in coastal habitats such as large intertidal sandflats, banks, mudflats, estuaries, inlets, harbours, coastal lagoons and bays. It has also been recorded in coastal sewage farms and saltworks, saltlakes and brackish wetlands near coasts, sandy ocean beaches, rock platforms, and coral reef-flats. It is widespread around the coast, from Eyre to Derby (TSSC 2016). They are uncommon in the south west (Nevill 2013). | Highly Unlikely There is no suitable habitat for this species within the survey area. | Highly Unlikely There is no suitable habitat for this species within the survey area. |
| Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit | CE | VU |  | X |  | The Bar-tailed Godwit (northern Siberian) is found mainly in coastal habitats such as large intertidal sandflats, banks, mudflats, estuaries, inlets, harbours, coastal lagoons and bays. It is found often around beds of seagrass and, sometimes, in nearby saltmarsh. It has been sighted in coastal sewage farms and saltworks, saltlakes and brackish wetlands near coasts, sandy ocean beaches, rock platforms, and coral reef-flats (DotEE 2018a). They are uncommon in the south west, but can be sighted from Geraldton to Bunbury, at Alfred Cove, and then at a few estuaries on the south coast including Kalgan River Mouth and Oyster Harbour (Nevill 2013). | Highly Unlikely There is no suitable habitat for this species within the survey area. | Highly Unlikely There is no suitable habitat for this species within the survey area. |
| Numenius madagascariensis Eastern Curlew | $\begin{aligned} & \mathrm{CE}, \\ & \mathrm{Mi} \end{aligned}$ | VU |  | x |  | The Eastern Curlew is most commonly associated with sheltered coasts, especially estuaries, bays, harbours, inlets and coastal lagoons, with large intertidal mudflats or sandflats, often with beds of seagrass. Occasionally, the species occurs on ocean beaches (often near estuaries), and coral reefs, rock platforms, or rocky islets. The birds are often recorded among saltmarsh and on mudflats fringed by mangroves, sometimes within the mangroves, and in coastal saltworks and sewage farms. In the south west, Eastern Curlews are recorded from Eyre, and there are scattered records from Stokes Inlet to Peel Inlet (Marchant \& Higgins 1993). They are uncommon further south of Geraldton, but can be spotted in Alfred Cove, Peel Inlet and the Albany region (Nevill 2013). | Highly Unlikely There is no suitable habitat for this species within the survey area. | Highly Unlikely There is no suitable habitat for this species within the survey area. |

| Oxyura australis Blue-billed Duck |  |  | P4 |  | X | The blue-billed duck is a small Australian almost entirely aquatic duck (Morcombe 2004). The blue-billed duck is endemic to Australia's temperate regions, ranging from the south west of WA, extending to southern Queensland, through New South Wales and Victoria, to Tasmania. The species is readily seen on freshwater lakes where deep fresh water is present (Morcombe 2004). | Highly Unlikely There is no suitable habitat for this species within the survey area. | Likely - There is suitable habitat for this species at Nowergup Lake. |
| Rostratula australis Australian Painted Snipe | EN, Mi | EN |  | X |  | The Australian Painted Snipe generally inhabits shallow terrestrial freshwater (occasionally brackish) wetlands, including temporary and permanent lakes, swamps and claypans. They also use inundated or waterlogged grassland or saltmarsh, dams, rice crops, sewage farms and bore drains. Typical sites include those with rank emergent tussocks of grass, sedges, rushes or reeds, or samphire; often with scattered clumps of lignum Muehlenbeckia, canegrass, or sometimes tea-tree (Melaleuca). It sometimes uses areas that are lined with trees, or that have some scattered fallen or washed-up timber (DotEE 2018a). In the south west it can be found around Carnarvon and wetlands north of Perth, particularly those west of Moora and Gin Gin (Nevill 2013). | Highly Unlikely There is no suitable habitat for this species within the survey area. | Likely - There is suitable habitat for this species at Nowergup Lake. |
| Sternula nereis nereis Australian Fairy Tern | $\begin{aligned} & \mathrm{VU}, \\ & \mathrm{Mi} \end{aligned}$ | VU |  | x |  | The Fairy Tern occurs along the coast of WA as far north as the Dampier Archipelago near Karratha, but mostly in the southern part of Australia including most of the coastline in the south west. It nests on sheltered sandy beaches, coastal inlets, spits and banks above the high tide line and below vegetation. It has been found in embayments of a variety of habitats including offshore, estuarine or lacustrine (lake) islands, wetlands, and mainland coastline (DotEE 2018a, Nevill 2013). They can also be seen in saltfields, saline or brackish lakes, and sewage ponds near the coast. | Highly Unlikely There is no suitable habitat for this species within the survey area. | Highly Unlikely There is no suitable habitat for this species within the survey area. |

| Actitis hypoleucos Common Sandpiper | Mi | IA |  | x | X | The Common Sandpiper is found along all coastlines of Australia and uses a wide range of coastal wetlands and some inland wetlands, with varying levels of salinity, and is mostly found around often narrow and steep muddy margins or rocky shores. The species has been recorded in estuaries and deltas of streams, as well as on banks further upstream; around lakes, pools, mangroves, billabongs, reservoirs, dams and claypans, and occasionally piers and jetties. It is often found near mangroves, and sometimes in areas of mud littered with rocks or snags (DotEE 2018a). They are somewhat uncommon in the south west, but can be found on Rottnest and Penguin Islands, and along the south coast all the way to the Esperance region, including the inland lakes like Lake Warden (Nevill 2013). | Highly Unlikely There is no suitable habitat for this species within the survey area. | Likely - There is suitable habitat for this species at Nowergup Lake. |
| Calidris melanotos Pectoral Sandpiper | Mi | IA |  | x |  | In Western Australia, the Pectoral Sandpiper is rarely recorded (DotEE 2018a). It prefers shallow fresh to saline wetlands and is found in coastal lagoons, estuaries, bays, swamps, lakes, inundated grasslands, saltmarshes, river pools, creeks, floodplains and artificial wetlands. The species is usually found in coastal or near coastal habitat but occasionally found further inland. It prefers wetlands that have open fringing mudflats and low, emergent or fringing vegetation, such as grass or samphire. The species has also been recorded in swamp overgrown with lignum. They forage in shallow water or soft mud at the edge of wetlands (Higgins \& Davies 1996). | Highly Unlikely There is no suitable habitat for this species within the survey area. | Likely - There is suitable habitat for this species at Nowergup Lake. |
| Motacilla cinerea Grey Wagtail | Mi | IA |  | X |  | The Grey Wagtail is an opportunistic migrant to Australia. The species typically migrates to Indonesia occasionally landing in Australia. Most records for the species are from Northern Australia and South Australia (Morcombe 2004). The nonbreeding habitat only of the Grey Wagtail has a strong association with water, particularly rocky substrates along water courses but also lakes and marshes (DotEE 2018a). It can be found mainly in banks and rocks in fast-running freshwater habitats: rivers, creeks, streams, and around waterfalls, both in | Highly Unlikely There is no habitat for this species within the survey area. | Highly Unlikely There is no habitat for this species within the survey area. |

|  |  |  |  |  |  | forest and open country; but occurs almost anywhere during migration (Johnstone \& Storr 2004). |  |  |
| Pandion haliaetus Osprey | Mi | IA |  | X | X | Ospreys occur in littoral and coastal habitats and terrestrial wetlands of tropical and temperate Australia and offshore islands. They are mostly found in coastal areas but occasionally travel inland along major rivers, particularly in northern Australia. They require extensive areas of open fresh, brackish or saline water for foraging. They frequent a variety of wetland habitats including inshore waters, reefs, bays, coastal cliffs, beaches, estuaries, mangrove swamps, broad rivers, reservoirs and large lakes and waterholes. They exhibit a preference for coastal cliffs and elevated islands in some parts of their range but may also occur on low sandy, muddy or rocky shores and over coral cays (DotEE 2018a). The osprey is found along all of the south west coast line except east of Cape le Grand where it becomes scarce (Nevill 2013). | Highly Unlikely There is no suitable habitat for this species within the survey area. | Highly Unlikely There is no suitable habitat for this species within the survey area. |
| Tringa nebularia Common Greenshank | Mi | IA |  | x | x | The Common Greenshank is found in a wide variety of inland wetlands and coastal habitats of varying salinity. It occurs in sheltered coastal areas typically with large mudflats and saltmarsh, mangroves or seagrass, including embayments, harbours, river estuaries, deltas and lagoons, but less often in round tidal pools, rock-flats and rock platforms. The species uses both permanent and ephemeral terrestrial wetlands, including swamps, lakes, dams, rivers, creeks, billabongs, waterholes and inundated floodplains, claypans and saltflats, and artificial wetlands. They occur around most of the coast from Cape Arid in the south to Carnarvon in the north-west (DotEE 2018a), and are moderately common here given suitable habitat. They can be found in areas including Wannamal Lake, many Perth lakes, Alfred Cove, Peel Inlet, Vasse and Harvey Estuaries, and the Albany and Esperance regions (Nevill 2013). | Highly Unlikely There is no suitable habitat for this species within the survey area. | Likely - There is suitable habitat for this species at Nowergup Lake. |

| Bettongia pencillata subsp. oglibyi Woylie | EN | CR |  |  | X | Preferred habitat for the Woylie includes dense undergrowth, logs and rock-cavities and occasionally in burrows (Burbidge 2004). Scattered Woylie populations may be found throughout the Jarrah forest in the south-west corner of WA. Extant naturally occurring populations of the species are restricted to three small wheatbelt reserves - Dryandra Woodland, Tutanning Nature Reserve and Perup Forest. All are characterised by the presence of thickets of the plant Gastrolobium (Van Dyck and Strahan 2008). The species is now restricted to forests and areas where predation has been controlled (or excluded). It rests during the day in a wellconcealed nest, built over a shallow depression. The nest is most commonly built using long strands, of grasses, but other material such as strips of bark are also used (in the forest) or dried seagrass and/or triodia (in arid coastal areas) (Freegard 2007). | Highly Unlikely This species has experienced considerable population decline in the wild, and only naturally occurs in three Wheatbelt reserves in WA. The fragmented nature of the survey area and presence of feral cats and foxes would reduce the likelihood of the species. | Highly Unlikely This species has experienced considerable population decline in the wild, and only naturally occurs in three Wheatbelt reserves in WA. The fragmented nature of the survey area and presence of feral cats and foxes would reduce the likelihood of the species. |
| Dasyurus geoffroii Chuditch, Western Quoll | VU | VU |  | X | X | The Chuditch inhabits eucalypt forest (especially Jarrah, E. marginata), dry woodland, mallee shrublands, heaths, and desert, particularly in the south coast of WA. They also occur at lower densities in drier woodland and mallee shrubland in the goldfields and wheatbelt, as well as in Kalbarri National Park (translocated). Chuditch require adequate numbers of suitable den and refuge sites (horizontal hollow logs or earth burrows) to survive (DEC 2012). In Jarrah forest, Chuditch populations occur in both moist, densely vegetated, steeply sloping forest and drier, open, gently sloping forest (Van Dyck and Strahan 2008). The species can travel large distances, and for this reason requires habitats that are of a suitable size and not excessively fragmented (DEC 2012). | Unlikely - The Chuditch had disappeared from the Swan Coastal Plain in the 1930s, (Orell and Morris 1994). Scattered individuals have since been recorded but these are considered disbursal individuals from the Darling range not a sustained population. | Unlikely - The Chuditch had disappeared from the Swan Coastal Plain in the 1930s, (Orell and Morris 1994). Scattered individuals have since been recorded but these are considered disbursal individuals from the Darling range not a sustained population. |

| Isoodon fusciventer Quenda, Southwestern Brown Bandicoot |  |  | P4 |  | X | The Quenda prefers dense scrubby, often swampy, vegetation with dense cover up to one metre high. However, it also occurs in woodlands, and may use less ideal habitat where this habitat occurs adjacent to the thicker, more desirable vegetation. On the Swan Coastal Plain, Quenda are often associated with wetlands. The species often feeds in adjacent Jarrah and Wandoo forest and woodland that is burnt on a regular basis and in areas of pasture and cropland lying close to dense cover (Van Dyck and Strahan 2008). | Known - The species was recorded during the survey | Known - The species was recorded during the survey |
| Notamacropus irma <br> Western Brush Wallaby |  |  | P4 |  | X | The Western Brush Wallaby is found primarily in open forest or woodland, particularly favouring open, seasonally-wet flats with low grasses and open scrubby thickets. It is also found in some areas of mallee and heathland, and is uncommon in karri forest (Van Dyck and Strahan 2008). | Known - The species was recorded during the survey | Known - The species was recorded during the survey |
| Parameles bougainville subsp. <br> bougainville Western Barred Bandicoot | EN | VU |  |  | X | The Western Barred Bandicoot is now restricted to Bernier and Dorre Islands in Shark Bay, but was reintroduced to Heirisson Prong and to Faure Island in Shark Bay, although they are presumed extinct at the former. Historically the Western Barred Bandicoot occupied a wide variety of semi-arid and arid landscapes and vegetation types, including the saltbush covered Nullarbor Plain, sand ridges with woodlands, bluebush plains, desert Acacia, dense shrublands (particularly thickets of Allocasuarina seedlings) and heath, broken by sandhills and limestone outcrops in western central Australia. On Bernier and Dorre Islands, the populations are found widely in all habitats, but are most likely found in tall scrub (Richards 2012; Van Dyck \& Strahan 2008). | Highly Unlikely- <br> The mainland subspecies of the Western Barred Bandicoot is extinct. | Highly UnlikelyThe mainland subspecies of the Western Barred Bandicoot is extinct. |

| Petrogale lateralis subsp. lateralis Black-flanked Rock-wallaby | VU | EN |  |  | X | Current known Black-flanked Rock-wallaby populations remain restricted to suitable habitat in the Little Sandy Desert, Cape and Calvert Ranges, with seven populations in the Wheatbelt region, Barrow and Salisbury Islands, and Ningaloo Station. Populations have been re-established via translocation to a number of sites in the Avon Valley and Cape le Grand National Parks and Paruna Sanctuary. In the south-west, colonies are largely confined to scattered granite outcrops in remnants of mallee scrub surrounded by cleared agricultural land. The habitat varies between colonies but always involves grassland feeding habitat for feeding in close proximity to cliff, rock-pile, talus or escarpment refuge habitat. Rock cliffs or other steep substrates with adequate shelter and refuge are essential for breeding (Pearson 2013; Van Dyck \& Strahan 2008). | Highly Unlikely There is no suitable habitat present within the survey area for this species. The survey area is outside its currently known distribution. | Highly Unlikely There is no suitable habitat present within the survey area for this species. | Neelaps calonotos Black-striped Snake |  |  | P3 |  | x | The Black-striped Snake is a burrowing snake that is restricted to the southwest coastal regions of WA, on sand plains along the Swan Coastal Plain, from Dongara south to Mandurah (Wilson and Swan 2017). | Likely - Suitable habitat for the Black-striped Snake is present within the survey area and there are a number of records of this species within the study area (DPaW and WAM 2013). It is likely to only occur in larger areas of contiguous native vegetation within the survey area. | Likely - Suitable habitat for the Black-striped Snake is present within the survey area and there are a number of records of this species within the study area (DPaW and WAM 2013). | Ctenotus gemmula Jewelled southwest Ctenotus(Swan Coastal Plain population) |  |  | P3 |  |  | Apparently disjunct populations occur on the lower west coastal plain, and south coast and adjacent interior of Western Australia. Known to occur on pale sands supporting heaths in association with banksia or mallee woodlands (Wilson and Swan 2017). | Likely - There is suitable habitat present for this species within the survey area. The closest known record is approximately 13 km south east of the survey area from Melaleuca Park. | Likely - There is suitable habitat present for this species within the survey area.
